EXECUTIVE SUMMARY

In the Spring of 2023, the Town of Burlington, Massachusetts retained the design team led by Kaestle Boos Associates (KBA) of Foxborough, MA, to provide consulting and design services to evaluate the Burlington Police Departments existing facility and its capacity to meet the current and future needs of the department. Part of the evaluation of the facilities is to determine the feasibility of adding/renovating it or construction of all-new facility on or near the existing site to service the Town's Police departments needs for the next 40 years.

The design services included evaluating the functionality of the current facilities spaces, developing a space needs assessment, and developing preliminary design program for the facility. At the same time the Mechanical, Electrical, Plumbing & Fire Protection Engineers (M.E.P.) examined the local utilities and building conditions to propose alternative M.E.P. systems. The proposed design options, site development plans and mechanical, plumbing, and electrical systems are described further within the study.

The proposed facility design will meet all current Massachusetts State Building, Energy, Fire and Energy Codes & Massachusetts Architectural Access Board (MAAB) requirements. In addition, operational recommendations from National Fire Protection Association (NFPA) 1221 - Standard for the Installation, Maintenance, and Use of Emergency Services Communications Systems, will be incorporated into the recommended designs.

Within the existing police facility many of the operations and workspaces are extremely cramped by insufficient space. The original structure (Union School) is in excess of one hundred years old and has functionally outlived its useful service life for police operations.

Below are examples of non-compliant code or safety standards, conditions observed at the existing facilities. A complete list is included in the study report. These conditions expose the Police Department staff to safety hazards and the Town to liability.

1. Building Code:
   a. Structurally the facility does not meet current seismic (earthquake), lateral (wind) or gravity loading design and would likely suffer major damage in a seismic, high wind or heavy snow event, a situation in which demand for emergency response would peak.
   b. The building envelope does not meet the newly adopted Energy Stretch Code, which now includes additions/renovations to existing building.
   c. Only one means of egress (stair) from the second floor exists, while two are required by code to ensure safe exist route in case of fire.
   d. Existing stairs are not wide enough, rails are too short and lack balusters, risers are too tall, treads are too short and the stair is not enclosed in a fire rated enclosure.

2. Plumbing Code:
   a. Fixtures do not meet water conservation requirements
   b. Fixtures are not handicapped accessible (some locations).

3. HVAC Code:
   a. Air handling equipment has outlived its service life and must be replaced.
   b. Non-compliant amount of fresh air changes (insufficient ventilation per Code).

4. Electrical Code:
   a. Most systems (lighting, power, emergency lighting, and fire alarm) no longer meet code requirements or safety standards.
   b. Emergency generator is not code compliant and does not have sufficient capacity to support all building systems and must be replaced.

5. ADA/MAAB (handicapped accessibility)
   a. No elevator to upper or lower levels
   b. Stairs are not handicapped accessible and do not provide areas of refuge
   c. No public toilets. Public is forced to use existing staff toilet/shower/locker facilities which are not handicapped accessible (turning radius', reach limits, thresholds….)

All of these issues, and others identified in the 'Code Review' & "Existing Conditions Survey' sections of the study will need to be addressed in any addition/renovation or new construction recommendation.

Based on the Space Needs Assessment, with subsequent meetings with department staff, conceptual design solutions for the new facility were developed. To minimize the building's footprint a two-story plan with a basement was developed. Adjacencies established in the Space Needs Assessment served as the basis of each floors organization, with the basement housing training functions (firing range, fitness, simulator, archives and mechanical spaces) with the main level largely being utilized be patrol functions (detention and sallyport, male and female locker rooms, training room, and patrol office) leaving the upper level to administrative functions (command staff, detectives and dispatch uses).

This plan was used to complete a detailed site analysis on three Town owned sites recommend by the Town. Site 1 (Vinebrook) was determined not to be viable as nearly all of the site was either wetlands or in the FEMA Flood Zone; Site 2 (Land on access road to the High School) was also determined not to be viable due to only allowing a single site access requiring construction within the wetlands and additional land acquisition from Mount Hope Christian Center for secondary access and no street visibility; Site 3 (Existing Police site) was determined to be a viable site once the existing building is demolished, as it provides multiple points of access, has no wetlands, has current public visibility, minimal impact on current traffic flow and is relatively level. Information on the Preferred Design Option, including site layout, building layout, and a conceptual rendering, can be found in Section 6 of this report.

After analyzing the pro's and con's for each of the proposed sites, it was determined that Site 3 (existing Police site) is the only option. This report will make clear that the site is sufficiently sized to accommodate a new police station building of this size. However, given the building square footage and parking requirements, it was important to be efficient with the building footprint as it relates to the overall site plan.

After multiple design reviews/revisions with the police administration the Preferred Design Option was submitted to Miyakoda Consulting to develop a Construction Cost Estimate. The estimate served as the basis for developing an Opinion of Total Project Cost of forth six million, two hundred twenty two thousand and eight dollars ($46,222,800). Documentation for the estimate is presented in Section 6 of this report.

- CODE ANALYSIS -

THIS PAGE INTENTIONALLY LEFT BLANK

CODE ANALYSIS

APPLICABILITY

This analysis reviews the existing Burlington Police Department Headquarters Facility in Burlington, MA, with regard to the Massachusetts State Building Codes ("Code") for new construction. The 9th Edition of the Massachusetts State Building Code consists, in part, of the 2015 International Building Code (IBC) and the 2015 International Existing Building Code (IEBC) with Massachusetts Amendments to these codes.
Codes used in this analysis are:

International Building Code (IBC, 2015)
International Existing Building Code (IEBC, 2015)
International Energy Conservation Code (IECC, 2018)
Massachusetts State Building Code Amendments (780 CMR 9th Edition)
Architectural Access Board Rules and Regulations (AAB, 521 CMR, 2006)
International Plumbing Code (IPC 2015)

Code compliance with regard to mechanical systems, including electrical, plumbing, fire protection systems and site work are reviewed in separate sections of this study.

Upgrades and corrections to existing structures undergoing renovations are limited to specific items under the IEBC. During renovations, not all existing safety issues and non-compliant conditions are required to be corrected; typically only items within each renovated area are required to be corrected. However, non-compliant conditions at stairs and egress elements, fire rating separations, accessibility, and fire protection (sprinklers) are required to be corrected or provided as new as required by the IBC. Because the original building was constructed almost one hundred and thirty years ago, existing conditions which may be allowed to remain under the requirements of the IEBC may also be in conflict with current life safety codes and standards. Over time, since the original construction of these buildings, life safety standards have been improved in reaction to tragic events. *In order to evaluate life safety conditions in accordance with the most current intent of these codes, the current IBC and Fire Safety codes and regulations are used as a basis for judging compliance.*

Correcting existing conditions to comply with current Accessibility and Fire Protection requirements is required when the value of the work exceeds the cost or scope triggers stated in the AAB and the Fire Code.

Compliance with Massachusetts General Law M.G.L. Chapter 148 Section 26G is required in all existing buildings in which renovations will exceed 7,500 square feet in area *or* in which major alterations' are planned, as defined by the statute. Under these conditions, an existing building **must provide a full sprinkler fire suppression system if sufficient water flow and pressure is available.** A major alteration is defined as a reconfiguration of walls, doors, windows, mechanical systems, etc., which effectively makes installation of sprinkler systems easier and which affects more than 33% of the building area ***or*** more than 33% of the assessed value of the building. Buildings for which sufficient water flow and pressure *does not exist* are exempt, however, it is assumed that sufficient flow and pressure is available and all code discussions below are based on this building being fully sprinklered.

Also, according to this section of **M.G.L.**, any work performed, even if under separate contracts or building permits, within a 5 year period must be included in the aggregate construction cost to determine applicability of M.G.L. This includes site work and building renovations, whether done separately or together.

- Future Change Orders and other unanticipated costs could also trigger full compliance if the aggregate value exceeds the 33% limit.
- Cost of future building projects requested for permit within 5 years, before or after the permit date for this project, will be considered part of the project costs and may trigger compliance.

Accessibility in public buildings is regulated by 521 CMR, which is enforced by the Massachusetts Architectural Access Board (MA AAB) and the Building Inspector of the municipality. 521 CMR, as issued in 2006, is used for this review.

MA AAB 5.1 Definitions states:

"Public Buildings: A building privately or publicly financed that is open to and used by the public",

MA AAB 11.1 Commercial Buildings states:

"The design of commercial *buildings* shall comply with 521 CMR, except as specified or modified in 521 CMR 11.00. Commercial *buildings* are *public buildings* … as well as city and town … *facilities*."

The Police Facility is considered a public and commercial building and so is required to be accessible in accordance with 521 CMR.

Currently, the AAB regulates only areas and conditions accessed by the "public"; areas occupied solely by staff are not included in the regulation. Staff areas are included in the ADA Accessibility Guidelines as part of federal law, but these are not directly enforceable as part of the Building Code. However, in an effort to unify compliance requirements with the recently adopted IBC as the State Building Code, the AAB will be revising the regulation to include staff areas as well as public areas. In anticipation of the release of the revised AAB regulations, all discussions below regarding accessibility will include compliance of staff areas.

Applicability of the AAB Regulations for renovations of existing buildings is based on the value of the renovations as a percentage of the current assessed value of the building (100% valuation). According to AAB 3.3, partial compliance is required when the value of the renovations exceeds $100,000 and full compliance of the entire facility is required when the value of the renovations exceeds 30% of the assessed value of the building. An exception to this rule is for maintenance work on MEP systems, sprinkler systems, roofs, replacement windows, masonry repair, site utilities, landscaping, and septic system which in aggregate is less than $500,000.

As stated in AAB 3.3 (paraphrased):

"3.3 EXISTING BUILDINGS

All additions to, reconstruction, remodeling, and alterations or repairs of existing public buildings or facilities …shall be governed by all applicable subsections in 521 CMR.

3.3.1…,

a. if the work costs less than $100,000, then only the work being performed is required to comply with 521 CMR…,

b. if the work costs $100,000 or more, then the work being performed is required to comply with 521 CMR. In addition, an accessible public entrance and an accessible toilet room, telephone, drinking fountain (if toilets, telephones and drinking fountains are provided) shall also be provided in compliance with 521 CMR…,

3.3.2 If the work performed, including the exempted work, amounts to 30% or more of the full and fair cash value (see 521 CMR 5.00) of the building the entire building is required to comply with 521 CMR. "

Also, according to AAB 3.5, any work performed, even if under separate contracts or building permits, within a 3 year period must be included in the aggregate construction cost. This includes sitework and building renovations, whether done separately or together.

- Future Change Orders and other unanticipated costs could also trigger full compliance if the aggregate value exceeds the 30% limit.
- Cost of future building projects requested for permit within 3 years of the permit date for this project will be considered part of the project costs and may trigger compliance.

The building and site must be reviewed together and may affect compliance in areas not anticipated to be updated to comply.

- If a building's renovation cost exceeds 30% of the building assessed value, then the *entire building and site* must be made to comply;

Energy conservation, as required by the IECC for new construction, is not required for renovations to existing structures under the IEBC. However, per the Massachusetts amendments to the IECC, any existing building elements or alterations to the exterior building envelope, such as new windows or new roofing, must comply to the greatest degree possible. As stated in the Massachusetts amendments to the IECC per AA104 "*For alterations, renovations, additions or repairs of existing buildings in these municipalities, the energy efficiency requirements of 789 CMR 13.00 or Chapter 11 of CMR 51.00 shall be used as applicable based on the use and occupancy of the building".* Overall upgrade of the exterior envelope of this building is required so is reviewed as part of this study.

GENERAL INFORMATION

According to the Town of Burlington Assessors Department, the Police Headquarters Building is located at 45 Center Street; construction of the facility completed in **1897** and was added onto in 1923 and most recently in 1991. The area of the building is listed on the Assessor's Card as 24,000 total gross square feet (GSF).

The current assessed value of the Police Headquarters building (structure only) is $**2,925,300.**

- The threshold value of the cost trigger for accessibility (full compliance) is 30% of this value less the cost of permitted work within the last 3 years.
- The threshold value of the cost trigger for fire protection is 33% of this value less the cost of permitted work within the last 5 years.

This cost threshold is shown below. The cause of the renovation or the source of the funding is not relevant, only the total value of cost for renovations, including demolition. Any work within these time limits which exceed these cost triggers will require that the entire structure and site be modified to be compliant. Because each threshold is based on the aggregate value of recent work (requiring a building permit) over the most recent 3 or 5 years, respectively, these threshold values are dynamic and will change based on the aggregate value of recent projects over time. The values below are only a guide and should be recalculated when a new renovation project is considered.

COST THRESHOLDS FOR ACCESSIBILITY AND FIRE SUPPRESSION COMPLIANCE	
Assessed Value (Structure Only)	$**2,925,300**
30% Cost Trigger for Accessibility Compliance	**$877,590**
33% Cost Trigger for Fire Protection	**$965,349**

AGGREGATE TOTAL VALUE OF RECENTLY COMPLETED WORK		
Date	Description	Approximate Value
	None	
3 year aggregate total value for accessibility compliance		**$ 0.00**
5 year aggregate total value for fire protection compliance		**$ 0.00**

ACCESSIBILITY UPGRADE REQUIREMENT	
30% of Assessed Building Value	**$877,590**
Less the Aggregate Cost of Projects Completed in the Past 3 Years	**$ 0.00**
Current Value for Renovation Work to the Cost Trigger for Full Accessibility Compliance	**$877,590**

Fire Protection Upgrade Requirement	
33% of Assessed Building Value	**$ 965,349**
Less the Aggregate Cost of Projects Completed in the Past 5 Years	**$ 0.00**
Current Value for Renovation Work to the Cost Trigger for Full Fire Protection Compliance	**$ 965,349**

There are two building permits on file with the Inspectional Services Department dated within the last three years.

BUILDING CODE COMPLIANCE ANALYSIS (IEBC / 780 CMR - IBC)

Although the Police Headquarters Building would be regulated under the IEBC for the purposes of a renovation of the existing building, this analysis reviews compliance with regard to requirements of the new IBC. This is to ensure that existing conditions which do not meet the current intent for life safety, and which may be allowed to remain as part of a renovation under the IEBC, are identified for correction. In the discussion below, references to specific code sections are noted before each paragraph with parentheses.

(IEBC 101.4.2) Applicability: Under this definition, as a building that has been previously occupied prior to the issuance of the Code, this building is considered an existing building and regulated under the IEBC.

(IEBC 301.1.1) IEBC offers three methods for compliance analysis and four levels of work classification. For the purposes of this study, the *Work Area Compliance* method will be used and future renovations will be considered as an *Alteration Level 3* work classification.

(IEBC 901.2) Compliance: All new elements must comply with IBC.

**The following discussions regarding Type of Construction, Use Group Classification, and Height and Area Limitations are provided to document the existing facility classification only. These characteristics are not regulated by the IEBC and existing buildings are not required to be modified to comply as a result of renovations. Additions to an existing building, however, must conform to current limitations of allowable height and area and are regulated by the IBC. Determination of the allowable height and area of the existing structure provides guidance for the extent of any new additions that may be planned.*

(IBC Ch. 3 – Use and Occupancy)

(IBC 303.4) Primary Use Group:	Group B - Business
(IBC 304.1) Mixed Use Areas:	Group A-3 Assembly (Training Room)
(IBC 311.2) Mixed Use Areas:	Group S-1 Storage (Sallyport)
(IBC 308.5.5) Mixed Use Areas:	Group I-3 Institutional Condition 5 (Detention area/cells)

(IBC Ch. 5 – General Building Limitations)

Height and area limitations for the existing building are presented below to show the allowable area for the uses within the building and possible expansion of the existing building. As stated above, the aggregate area of any new additions and renovations that exceed 7,500 square feet or that exceed 33% of the assessed value of the existing building will require sprinklers to be installed throughout the new and existing structure. The allowable floor area calculations below include increases permitted for fire protection sprinkler system, and the increase for existing building frontage accessible to emergency vehicles. This allowable increase in area for accessible frontage may be affected by additions to the building.

According to information from the Burlington Assessing Department, the current building area is listed at 19,862 gross square feet (occupied space) for all floors combined. Storage uses and Assembly uses are believed to occupy less than 10% of the gross area of the relative floor levels and so are considered to be accessory to the Business Use on each floor.

(Table 503) Based on the presumption that any renovation or new construction for this building will require the installation of a new sprinkler system, the allowable height may be increased by one story and the allowable area may be increased by 400%. Additionally, as the building perimeter is accessible for fire and rescue vehicles from the road or parking areas on all sides of the building, the maximum allowable area may be increased by an additional 50% for this accessible frontage.

- The accessible street frontage combined with the allowable area increase for a sprinkler system will allow a total increase in area of 450% in addition to the limitations stated in Table 503. This total allowable area is shown in the last column of the table below.
- The total area of the building cannot exceed the allowable area used for the primary Business ("B") Use Group. Other uses within the mixed use building cannot exceed an area proportional to the percentage of the area that Use Group occupies in the building. Because this ratio of allowable areas between uses may vary based of differing layouts, it is impossible to provide an allowable area for all uses in every possible combination. As such, the allowable area for Use Group B is calculated as a baseline and further calculation will be required to confirm if future renovations are within Code requirements.

(Table 504.4 & 506.2) The allowable height and area for each Use Group under Type V-B (5-B) Construction is:

USE GROUP	**Total Allowable Height (+1 Story Increase for Sprinkler System**	**Allowable Area per Story Plus Increase for Sprinkler System and Accessible Perimeter**			
		Allowable Area (Table 506.2)	**Sprinkler System Area Increase (+400%)**	**Accessible Perimeter +50%**	**Total Allowable Area per Floor with Allowable Increases**
B	3 Stories	9,000 sf.	+ 36,000 sf.	+ 4,500 sf.	49,500 sf.

(IBC 506.2.4 & 508.4) Buildings with multiple Use Groups are called mixed-use buildings. Buildings are further classified as a 'separated' mixed use or a 'non-separated' mixed use. If classified as a 'separated' mixed-use building, the different use groups within the building must be separated by fire rated construction as required in Table 508.4. If classified as a 'non-separated' mixed-use building, then fire rated separations are not required BUT the most restrictive use group is used to calculate the allowable height and area. This building is assumed, based on field observations, to be a non-separated mixed-use building. (IBC 508.2.4 and Table 508.4) In table 508.2.4, rooms used for storage and assembly may be considered to be accessory to the primary Use Group if the aggregate area of these rooms is less than 10% of each floor area and smaller than the area allowed by Table 503. Spaces considered to be accessory to the primary use are not required to be separated from the primary use by fire rated partitions. This report assumes that all Storage and Assembly uses are considered to be accessory and so not separated.

IBC Ch. 6 – Types of Construction

(IBC Table 601) No information is provided by the Burlington Assessing Department with regard to the type of construction of the building. As observed in the field, the building is constructed of wood framed bearing walls supporting the Main and Upper floors, Attic and gable roof structures. The Upper Level floor is wood framed with joists and interior bearing walls. The attic and roof are framed with wood trusses spanning the width of the building and supporting wood floor joists and roof purlins.

As the existing construction system is assumed to be wood framed construction with non-fire rated structural members, this generally conforms to the requirements for Type V-B (Roman numeral 5 - B, unprotected)

construction in the current IBC. The structure does not appear to be protected with spray fireproofing or other rated construction. Interior partitions are believed to be a combination of non-load bearing stud / drywall construction and load bearing masonry. The Use Group is assumed to be Business(B) with accessory or mixed use areas for Assembly and Storage.

Type V-B Construction Type Min. Fire Resistance Rating Requirements (780 CMR Table 601)

Building Elements	Required Fire Resistance Rating (Hrs)
Primary Structural Frame (including columns, girders, and trusses)	0
Exterior Bearing Walls	0
Interior Bearing Walls	0
Exterior Non-Bearing Walls and Partitions (See Table 602)	0
Interior Non-Bearing Walls and Partitions	0
Floor Construction (including support beams and joist)	0
Roof Construction (including support beams and joist)	0

Table 601 establishes the required minimum fire rating of construction elements and is related to the allowable height and area discussed in Table 503 below. Type V-B (5-B) construction allows the building structural members to be unprotected (not fire rated). The tradeoff for not protecting the building structure is a reduction in the allowable height and area that can be built; essentially, the greater the fire protection of building structural elements, the larger the building height and area which is allowed.

(IBC Chapter 10 - Means of Egress)

Occupancy load in the existing facility is determined by the functions in each area of the building and not the primary use group. According to the IBC Table 1004.1.2, Business functions require an occupant load calculated at 100 GSF per person, Locker rooms are calculated at 50 GSF per person, and Mechanical/Storage areas are calculated at 300 GSF per person, and Assembly spaces are calculated at 5, 7, or 15 GSF per person dependent upon whether the persons are standing, sitting, or at tables. As the functions and areas for each may change over time, areas with lesser occupancy rates may be renovated for a use with a higher occupancy rate. This summary will not break out each function separately; as a preliminary determination of occupancy, a rate of 100 GSF per person will be used as an overall general occupancy rate for this building as this will be the predominant occupancy for any renovation of the building:

- 19,862 GSF (All Floors) / 100 sf. per occupant = 199 occupants on all floors

The egress capacity (0.3”/per occupant for non-sprinklered buildings) for a minimum 44-inch wide stairway is approximately 146 occupants.

IEBC 101.2.2.1 is an amendment by the State of Massachusetts and supersedes other less restrictive paragraphs in the IEBC. This amendment requires that all existing stairs comply with current requirements of the IBC with regard

to the quantity of exit ways on each floor, the width of all exit ways, fire rating, handrails, continuity, etc., to "provide safe and adequate means of egress".

- The existing egress stair in the building is not enclosed in required fire rated construction, does not have risers and treads of required dimensions, does not have railings and guards on both sides of the stair, does not have railings and guards with required height and spacing, does not have required rail extensions, and does not have fire rated doors which comply. All stair conditions must be corrected in accordance with current egress requirements as part of any renovation project.

(IEBC 803.2.1 Existing Vertical Openings)
All existing vertical openings connecting 2 or more floors must have an enclosure with a fire-resistive rating of 1 hour minimum with approved opening protectives.

- The stair connecting the basement, main, upper and attic levels is a vertical opening. This opening is not separated from adjacent areas by fire rated construction. This stair cannot be used as an exit in its current configuration..

(IBC Table 1017.1 Exit Access Travel Distance)

- The greatest travel distance to an exit enclosure occurs on the 2nd floor and is approximately 100 feet. This is far less than the allowable travel distance of 300 feet.

(IBC 1014.3) In buildings of a Business Use with a sprinkler system, the allowable length of a common path of travel is 100 feet.

- All locations appear to be compliant.

(IBC 1020.4) In buildings of a Business Use with a sprinkler system, the allowable length of a dead end corridor is 50 feet.

(IBC 1007.1.1) When multiple exits are required, the exits must be separated by a minimum distance equal to 1/2 of the longest diagonal distance of the floor plate.

- There are two non-compliant Exits from the main floor and upper floors. As a result separation distance is not applicable.

(IBC 1006.3.1) All stories are required to provide a minimum of 2 means of egress. As this building is classified as a Business B Use Group, a minimum of 2 means of egress must be provided.

ACCESSIBILITY CODE COMPLIANCE ANALYSIS (521 CMR AAB)

AAB 11 – Commercial Buildings (Municipal Facilities)

(521 CMR 11.1)
Public Areas, Toilet rooms, transaction counters and other work areas are required to be accessible.

- Accessible transaction counters at First Floor Public Lobby is not provided.
- Accessible male and female toilet rooms are provided for public use in the First Floor Lobby.

AAB 14 – Places of Assembly

(AAB 14.2) Places of assembly are not provided in the existing building.

AAB 19 – Recreational Facilities
(AAB 19.4) Locker rooms are provided for male and female staff and officers. These lockers and associated toilet rooms are not required to be accessible.

AAB 20 - Accessible Routes
(AAB 20.1) Accessible routes within the building generally comply with requirements for width, passing space, protruding objects, headroom, etc.

- Access to all floors is not provided for public and administrative staff. A compliant elevator is required to provide access to all floor levels and activities.
- Many doorways reviewed do not provide required clearance for accessibility.

(AAB 20.6.1) Objects projecting from walls with their leading edges between 27 inches and 80 inches above the finished floor must not protrude more than 4 inches into walks, halls, corridors, passageways or aisle and must not have sharp edges.

- There does not appear to be any non-compliant conditions.

(AAB 20.12) Areas of rescue assistance at stairways and means of egress are not required in accordance with Exception b. buildings or facilities having a supervised automatic sprinkler systems.

AAB 24.00 - Ramps
There are no ramps required on the exterior of the building.

AAB 25.00 – Entrances
(AAB 25.1) All public entrances to the building must be accessible and be on an accessible route.

- Access to the building from the exterior is compliant at the Ground Level public entrances.

AAB 26.00 – Doors and Doorways
(AAB 26.6 – Maneuvering Clearances)
Many doors in the building do not provide required pull and push clearances for accessible doors. In public areas or areas accessed by civilian staff, modify these doorways to provide accessible clearances.

(AAB 26.11 - Door Hardware)
Existing hardware throughout building is not compliant and replacement with lever-type hardware at all doors is recommended .

AAB 27.00 – Stairs
(AAB 27.3 – Nosings)
Stair nosings are required to be angled or radiused and not abrupt. Existing wood stair nosings at the connecting stair between the Main Level and the Upper Floor have a protruding lip at each tread.

- The stair treads need to be modified to comply. Modification of the treads with tread covers is necessary to reduce the abrupt nosing.

AAB 28.00 – Elevator

(AAB 28.1) Multistory buildings are required to be served by an elevator.

- The existing elevator does not meet the 'gurney' requirements of the code and must be replaced.

AAB 32.00 - Kitchens

(AAB 32.1) Commercial kitchens are not regulated by the AAB.

AAB 36.00 – Drinking Fountains

(AAB 36.1.1)

Code compliant drinking fountains are not provided within the building.

- Please refer to the plumbing section of this report for discussion about requirements for drinking fountains

AAB 41.00 – Signage

(AAB 41.00)

Room signage with braille must be provided at all 'permanent rooms and spaces' as well as code required egress signage.

- Compliant signage and Symbols of Accessibility are missing throughout the building. Where exit signs indicate an accessible route, if all routes are not accessible, these signs shall include the symbol of accessibility.

EXISTING CONDITIONS - SUMMARY

As part of the feasibility study, KBA examined the Burlington Police Department's (BPD) existing facility to determine its ability to meet the current and future needs of the department. The evaluation of the existing facility is to determine the feasibility of adding/renovating or the construction of an all-new facility to service the Town's police department's needs for the next 40 years.

The existing conditions report commenced with a visual field inspection of the BPD's current facility by architectural staff and structural, mechanical, electrical, plumbing & fire protection engineers. They examined the condition of the local utilities, building systems for compliance with current codes and whether they have reached their expected life span. Additionally, the individual reports note actions required to bring each system into code compliance.

The criteria for the facilities evaluation and recommendations are based on meeting all current Massachusetts State Buildings, Fire and Energy Codes & Massachusetts Architectural Access Board (MAAB) requirements. In addition, operational recommendations from National Fire Protection Association (NFPA) 1221 - Standard for the Installation, Maintenance, and Use of Emergency Services Communications Systems, will be incorporated into the recommended designs.

Below are examples of non-compliant code or safety standard, conditions observed at the existing facility. A complete list is included in the individual reports. These conditions expose the Police Department staff, visitors and detainees to safety hazards and the Town to liability.

1. Building Code:
   a. Structurally the facility does not meet current seismic (earthquake), lateral (wind) or gravity loading design and would likely suffer major damage in a seismic, high wind or heavy snow event, a situation in which demand for emergency response would peak.
   b. Existing stairs are not compliant: rails are too short, missing or not continuous, risers are too tall, treads are too short, and stairs are not enclosed in a fire rated enclosure.
   c. The building envelop does not meet the newly adopted Stretch Code, which now includes additions/renovations to existing building.

2. Fire Protection:
   a. Sprinkler heads are outdated and need to be replaced with quick response heads

3. Plumbing Code:
   a. Fixtures do not meet water conservation requirements.
   b. Fixtures are not handicapped accessible (some locations)

4. HVAC Code:
   a. Air handling equipment has outlived its service life and must be replaced.
   b. Ductwork is not in good condition nor insulated in many locations and should be replaced.
   c. The exhaust system equipment has outlived its service life and must be replaced.
   d. Boilers could remain as supplemental heat source in support of new high efficiency variably refrigerant flow (VRF) which will provide heating and cooling to the building.
   e. Firing Range has an exhaust system however it does not appear to be equipped with a make-up air system.
   f. Non-compliant amount of fresh air changes (insufficient ventilation per Code).

5. Electrical Code:

a. Most systems (lighting, power, emergency lighting, and fire alarm) no longer meet code requirements or safety standards.
b. Emergency generator is not code compliant and does not have sufficient capacity to support all building systems and must be replaced.
c. Fire alarm system is outdated and needs to be replaced with a modern addressable system.
d. Site lighting needs to be changed to LED fixtures in many locations.
e. Interior lighting needs to be changed to LED type fixtures with a lighting control system.
f. Telephone/Data racks must be located in a properly designed space and all old cabling (CAT-5E) should be replaced with modern CAT-6A cable.

6. ADA/MAAB (handicapped accessibility)
   a. The elevator does not conform the current elevator code with regard 'gurney' requirements.
   b. Stairs are not accessible and do not provide areas of refuge.
   c. Existing staff toilet/shower/locker facilities which are not handicapped accessible (turning radius', reach limits, thresholds….)
   d. Room signage with braille must be provided at all 'permanent rooms and spaces' as well as code required egress signage.

All of these issues, and others identified in the 'Code Review' & "Existing Conditions Survey' sections of the study will need to be addressed in any addition/renovation construction to the building.

While it was evident that the existing facility currently provides space for the BPD to operate, it does not meet the current codes or the operational requirements for a modern Police Station. In all cases, the building has functionally outlived its useful service life for modern police operations. It is our recommendation that the existing building be demolished, and a new code compliant facility be built that will support the current and future needs of the Burlington Police Department.

EXISTING CONDITIONS – STRUCTURAL

BACKGROUND AND OVERVIEW

It is Weston & Sampson Engineer's understanding that the existing Burlington Police Station is comprised of an original structure, constructed during the 1890s, and an addition portion constructed in 1991. The original structure is classified as a historical building per the Town of Burlington's (Town) historic commission. Limited existing architectural plans were obtained for the 1991 addition, dated February 25, 1991, issued by the Preservation Partnership, which includes a layout of the original structure.

The Massachusetts State Building Code is anticipated to be updated to the 10th edition in 2024, incorporating the 2021 version of the International Building Code (IBC), and International Existing Building Code (IEBC). Weston & Sampson incorporated the IBC 2021 version of the International Building Code and IEBC with the intent to comply with the future 10th Edition of the Massachusetts State Building Code.

SITE EVALUATION SUMMARY

Representatives of the Weston & Sampson structural team, Kevin Connolly and Sydni Clark, conducted a limited visual assessment of the current Burlington Police Department building on January 16, 2024. The visual assessment included, but was not limited to, observations of visible portions of structural walls, slabs, and floor or roof framing. Access to roof framing was provided in both the 1890 original portion of the building and the newer addition, located in the mezzanine and the attic areas, respectively. The roof framing in both locations were observed to be timber rafters supporting plywood decking. Portions of the foundation in the original building area were visible in the mechanical room and electrical room. The foundation of the original structure was a mortared stone foundation wall, whereas the foundation of the newer addition was cast in place concrete.

The overall structure was found to be in fair condition. There were no observed signs of stress on exposed framing members, nor significant deterioration observed during the site walkthrough.

PROJECT UNDERSTANDING & CODE REVIEW

It is the understanding of Weston & Sampson that significant renovations to the interior space of the current building would be required to meet the needs of the building and its staff, as well as comply with current building code requirements. The renovations may include, but are not necessarily limited to: significant mechanical, electrical, and plumbing upgrades; fire protection upgrades; removal of hazardous materials; replacement of existing roof materials; increasing building security and other information technology upgrades; addressing water infiltration and moisture issues; and reconfiguration of existing spaces including removing or modifying interior partition walls. The International Existing Building Code (IEBC) identifies three alteration levels for building projects. The proposed renovations for this building are assumed to fall under Alterations – Level 3 in which the work area exceeds 50% of the building area.

The police station is considered an essential facility and in accordance with the IBC and the American Society of Civil Engineers (ASCE-7) is required to be designed as a Risk Category IV building. The IEBC requirements for Alterations Level 3 with Massachusetts State Building Code (MSBC) amendments require unreinforced masonry bearing walls to be anchored to the walls at roof and floor levels, unreinforced masonry parapets be braced for seismic forces, and unreinforced masonry partitions and nonstructural walls in the work area and adjacent to egress paths be anchored, removed or altered to resist out-of-plane seismic forces. The existing masonry walls in the building are assumed to be unreinforced. Verification of wall reinforcement could be completed using non-destructive testing methods during the design phase.

Considering structural work required from proposed renovations by other disciplines, the resulting work would be considered a "substantial structural alteration" by the IEBC. This would require the building to be evaluated for wind and seismic loading listed in the current edition of the International Building Code (IBC 2021). The mortared stone foundations in the original building area are assumed to be unreinforced, and it is likely that the original construction would fail in a lateral demand analysis. Consequently, substantial structural retrofitting of the building will likely be required to comply with the existing building code criteria to meet seismic demand. Other areas of the building that may need to be upgraded or reinforced include the roof diaphragm connections, and roof gravity load carrying members. The roof diaphragm connections in the original building portion will likely need upgrades for current IBC

wind load criteria. The gravity load carrying members in the original portion will likely not meet current snow loading requirements, which would require reinforcement of existing members, or providing additional load carrying members. Any other additional roof loading, including new MEP rooftop equipment or suspended elements, would have to be evaluated as part of the analysis.
Multiple areas of water damage were identified by the police chief during the visual assessment. Other areas were identified by the chief as not weather-tight, such as loose windows and improperly sealed exterior penetrations. Some of the moisture damaged locations were observed to have been previously repaired with new flooring and/or hard ceilings. Any moisture deterioration or damage to elements behind floors and ceilings which were not accessible to view and would need further investigation to determine the condition of structural framing. Minor repairs, such as holes in the roof deck, gypsum wall cracking, and basement slab fractures would need to be addressed during the renovation.

SUMMARY OF ANTICIPATED STRUCTURAL SCOPE OF SERVICES
A summary of potential structural scope is listed below:

1. Bracing of unreinforced masonry bearing walls at roof and floor levels.
2. Removal, anchorage or alteration of unreinforced masonry partition and non-structural walls for out-of-place seismic forces.
3. Evaluation of building for lateral seismic and wind loading. It is likely that the building foundations would need reinforcing to meet lateral demands. Additional bracing for the building frame may also be required.
4. Upgrade of, or addition to, existing roof diaphragm connections in original portion of the building to meet lateral demands and wind uplift requirements.
5. Reinforcement or addition of roof gravity load carrying members in original building portion.

There is potential for some structural repairs not listed above that may be required once the scope of work has been defined and the structural analysis has been completed. Not included as part of this scope of services is an opinion of probable cost associated with the structural repairs. A cost opinion can be generated by Weston & Sampson during the design phase.

EXISTING CONDITIONS - FIRE PROTECTION

The building is currently protected with an automatic sprinkler system. The system was installed as part of the 1992 building renovations and addition.

The fire service is 6-inch in size and includes a 6-inch reduced pressure backflow preventer and 6-inch wet alarm valve. The fire distribution main is 6-inch.

Piping is black steel with coupling or threaded joints depending on pipe size. In general piping appears to be in good condition. The building system is separated into multiple zones. Each sprinkler zone is controlled by a supervised shutoff valve and flow switch.

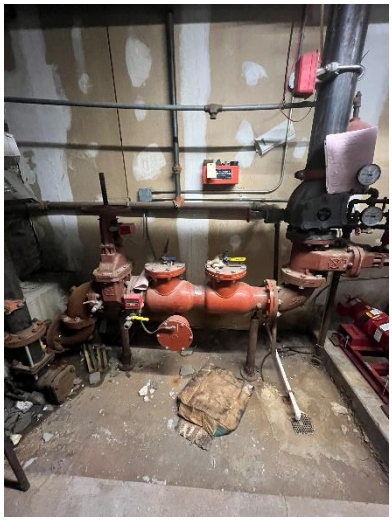
There is a free-standing Siamese Fire department connection (FDC). An electric bell is provided on the foundation wall adjacent to the FDC.

Recessed fire hose cabinets are provided on each floor.

Sprinkler heads are semi-recessed in the finished ceiling areas. Upright brass heads are provided in areas with no ceilings. Institutional type heads are provided in cell areas.

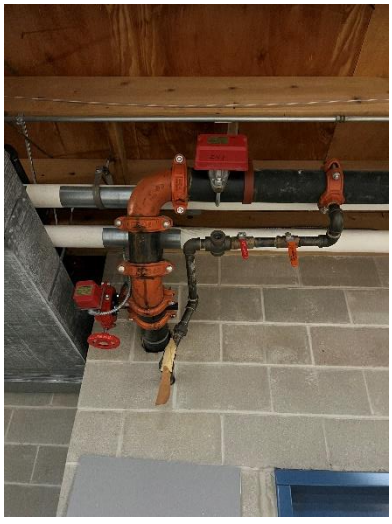
The unheated attic of the original building appears to be protected with a glycol system to prevent freezing.

The existing firing range does not appear to be adequately protected. Only a single row of sprinkler heads is provided in the space.



Fire service & backflow preventer

Fire Department Connection

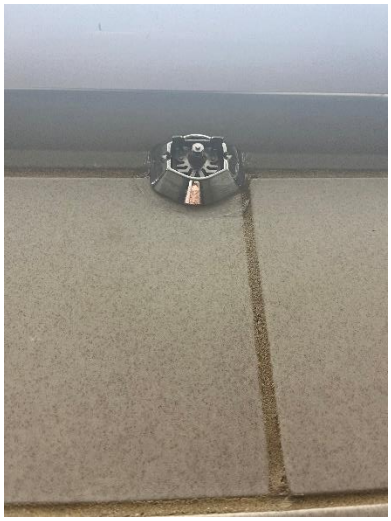


Sprinkler zone control valve assembly

Fire hose connection

Typical upright sprinkler

Semi-recessed pendent head



Institutional type sprinkler

Recommendations

- In major renovation, sprinkler systems can be modified to provide protection. Due to the age of sprinkler heads, we would recommend replacing all heads with quick response type sprinklers.
- Replace existing glycol sprinkler system in unheated attic with a dry type sprinkler system.
- Remove existing fire hose cabinets and replace them with 2-1/2" Fire Department valves.

EXISTING CONDITIONS – PLUMBING

Presently, the plumbing systems serving the building are cold water, hot water, sanitary, waste and vent system, and natural gas. Municipal sewer and municipal water service the building.

The plumbing systems have been updated as part of the 1992 building renovation and addition project.
The plumbing fixtures are in fair condition.

Cast iron is used for sanitary drainage. Where visible, the cast iron pipe appears to be in fair condition. Smaller pipe sizes appear to be copper. In general, the drainage piping can be reused where adequately sized for the intended new use.

Rainwater from sloped roof areas is collected by exterior gutters and downspouts. There does not appear to be interior rain leaders.

FIXTURES

The water closets are wall hung vitreous china with manually operated flush valves. Urinals are wall hung vitreous china with manually operated flush valves. In general lavatories are counter mounted with either manual faucets or metering type faucets.

Cell fixtures are stainless steel toilet/sink combination units. Fixtures are flushed remotely.

Electric water coolers are wall hung, with stainless steel bowls. A bottle filler is provided at the main level administration area.

Custodial sinks are generally floor mounted mop receptors with wall mounted faucets. The faucets are equipped with vacuum breakers.

Locker room showers have pressure balanced concealed shower valves with standard shower heads and shower pans.

The booking area has a wall mounted scullery sink with wall mounted faucet.

Wall hung water closet

Wall hung urinals

Typical lavatory

Cell fixture

Cell fixture remote flushing

Electric water cooler

Custodial sink

Booking area sink

WATER SYSTEMS

The main domestic water service is located in the basement. The service is 6-inch in size and reduces to a 1-1/2" water meter.

Piping, where exposed, appears to be copper with sweat joints. The majority of the piping is insulated.

There is a 1-inch reduced pressure backflow preventer provided for HVAC system make-up water. The assembly is not readily accessible for maintenance and is showing signs of corrosion.

Domestic hot water is generated through a tank type natural gas fired water heater. The water heater has a natural gas input of 199,999 BTUH and 100-gallon storage capacity. The hot water systems are recirculated. There is a thermostatic mixing valve on the systems to prevent scalding. The heating system appears to be in good condition.

Domestic water service

Domestic water meter

Domestic water heater
Backflow preventer – HVAC make-up

Thermostatic mixing valve

GAS

An elevated pressure natural gas service is supplied to the building. The exterior gas meter is located adjacent to the mechanical room.

Gas piping is black steel with threaded joints and fittings. Natural gas is provided to the heating boilers and the domestic water heater.

Gas piping appears to be in good condition.

DRAINAGE SYSTEMS

Cast iron is used for sanitary drainage. Where visible, the cast iron pipe appears to be in good condition. Smaller pipe sizes appear to be copper.

Sallyport floor drain is connected to an exterior oil water separator. The separator is vented up through the roof of the building.

In general, the cast iron drainage piping can be reused even in a major renovation where adequately sized for the intended new use.

RECOMMENDATIONS

Provide new high efficiency low flow plumbing fixtures.

Provide accessible fixtures where required. Provide accessible cell fixtures.

Replace existing backflow preventer for HVAC make-up water system and located in accessible location to facilitate testing and maintenance.

EXISTING CONDITIONS – H.V.A.C.

EXECUTIVE SUMMARY

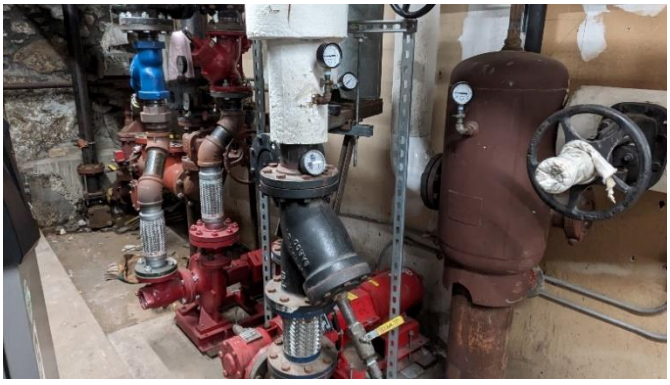
Presently, the HVAC Systems serving the Burlington Police Department consists of a natural gas-fired hot water boiler plant and various indoor air handling units. The building is heated by hot water terminal heating equipment, consisting of mostly unit heaters and fintube radiators. The building is equipped with a Building Automation System by Alerton, which controls the HVAC equipment automatically.

Most of the HVAC systems throughout the building have served past their anticipated life expectancy and are recommended for replacement.

HEATING SYSTEM

The building is heated by (3) high efficiency gas-fired condensing boilers manufactured by Lochinvar, model FTXL. The boilers appear to have been installed relatively recently and are in good condition. The boilers produce hot water which is distributed to heating terminal units and indoor air handling units located throughout the building. (2) Bell & Gossett pumps set up in a primary/standby configuration distribute the hot water throughout the building. The pumps and associated expansion tank and air separator appear to be quite old and look to be beyond their service life.

Existing Boiler Plant



Existing Expansion Tank and Valves

Most of the piping mains observed in the mechanical room are insulated but appeared to be damaged in some locations. In some instances, the piping branches to air handling units were uninsulated.

AIR CONDITIONING

Most of the building is air conditioned by several indoor air handling units that are located throughout the building. The air handling units have hot water coils and DX coils which heat or cool the air depending on the season. One of the air handling units was reported by a staff member to consistently leak in during the cooling season, indicating that there is an issue with the drainage of the condensation that is produced during the cooling process.

Typical Indoor Air Handling Unit

The DX coils are paired with air-cooled condensing units which are mostly located outdoors on the roof. However, there are a few air-cooled condensing units that are located in an attic space. It's typically not advisable to mount air-cooled condensing units indoors. The condensers need fresh air as a means of heat rejection, enclosing them in the attic can starve the condensers of the air they need, reducing their efficiency. Furthermore, the heat rejected by the condensers will heat up the attic, which creates additional cooling load on the spaces below the attic, causing the air conditioning units to work harder.

Outdoor Condensing Unit

Indoor Condensing Units

In roof mounted condensing units use R-22 refrigerant and appear to be beyond their life expectancy of 15 years. R-22 has also been phased out, which makes for a costly repair of these systems.

The indoor condensing units look to be in fair condition and utilize R-410A refrigerant. The tag on these condensing units indicate they were manufactured in 2017, with a life expectancy of 20 years they still have plenty of life in them. However, R-410A is also beginning to be phased out, so repairs of these systems may become costly in a couple of years.

HEATING AND VENTILATION

Entryways and stairwells are typically heated by wall mounted unit heaters. The remainder of spaces are typically heated by fintube radiators located along the exterior perimeter. The unit heaters appear to be in either good or fair condition. Unit heaters have a life expectancy of about 20 years, so depending on when they were installed, they may be at or nearing their recommended service life.

Unit Heater

Fintube Radiator

Ventilation is brought into the building through the air handling units described under the Air Conditioning section. The air handling units operate year-round to provide ventilation air to the building. In general, it appears that the outside air ducts are typically insulated, but the supply and return air ducts were often observed to be uninsulated. There is likely no energy recovery section in the existing units which may explain the lack of supply/return duct insulation. However, it would still be more efficient to insulate at least the supply duct so that none of the energy used to heat or cool the air is wasted.

There are several exhaust fans that serve various areas of the building. The fans appear to be in fair condition. With a life expectancy of 20 years, the fans may be nearing the end of their recommend service life depending on when they were installed.

It was also observed that the firing range is equipped with an exhaust system, but no source of makeup air was found. This can lead to pressure issues when the firing range exhaust system is running.

Exhaust Fan

CONTROLS

The building is equipped with a Building Automation System (BAS) by Alerton. The BAS monitors and controls major pieces of equipment, and monitors space temperatures which control space terminal heating/cooling equipment. The workstation with access to the BAS was not available at the time of our site visit. However, the BAS likely has the air handling units, associated condensing units, and any terminal units connected to it.

RECOMMENDATIONS:

Based on our findings as summarized above, the following recommendations are made with regards to HVAC system upgrades:

- Replace all indoor air handling units with all new units equipped with energy recovery, sand heating/cooling section, which will provide tempered ventilation to all occupied spaces.
- Replace all ductwork and provide all new supply and return ductwork with insulation on both duct systems.
- Provide a new, high efficiency, heat recovery Variable Refrigerant Flow (VRF) system to provide heating and cooling throughout the building.
- The existing boilers are still in good condition and could remain to provide supplemental heat on extremely cold days, or could be used as a backup source of heat in the event of a VRF condenser failure.
- Replace the existing pumps and associated accessories as they are nearing/beyond their anticipated life expectancy.
- Replace the existing exhaust systems with new fans and duct distribution systems to ensure the exhaust rates meet the code required exhaust rates.
- Provide a source of makeup air for the firing range when the exhaust fan serving this space is on.

- EXISTING CONDITIONS ANALYSIS -

a. SUMMARY

c. STRUCTURAL
d. ARCHITECTURAL
e. FIRE PROTECTION
f. PLUMBING
g. H.V.A.C
h. ELECTRICAL

DO NOT REMOVE
THIS PAGE INTENTIONALLY LEFT BLANK

EXECUTIVE SUMMARY – ELECTRICAL

In general, the electrical infrastructure is adequately sized for the existing police station and has been well maintained. The equipment is in acceptable condition to accommodate minor renovations to the existing building, however, would not be recommended for reuse in any type of new construction application and the size and scope of the renovations would need to be analyzed to confirm viability with the existing electrical system.

The existing emergency power system is not code compliant. The onsite emergency generator system is not configured correctly to meet current life safety codes and needs to be reconfigured to separate life safety and optional standby loads.

The existing fire alarm system is obsolete and in poor condition. The entire system should be replaced with a new addressable system with all new detection and notification devices.

ELECTRICAL DISTRIBUTION SYSTEM

Three phase primary power runs overhead from Center Street and then underground to a fenced in utility pad mounted transformer on the property. The utility company is Eversource. The secondary service entrance conductors travel underground to the main electrical room in the basement where they are terminated by a 1200 Amp main breaker in a GE switchboard. The service is rated at 1200 amperes at 120/208 volt, 3 phase, 4 wire. The switchboard contains the CT cabinet which feeds a dual meter socket adjacent to the switchboard in the main electrical room. Only one of the meter sockets is populated. The meter number is 08504708.

Power is distributed via distribution sections in the switchboard and emergency and non-emergency power distribution panels to branch circuit panel boards throughout the building. Distribution panels and equipment are manufactured by GE.

The power distribution equipment is in fair condition. There are available spaces in the distribution panels and most of the branch circuit panel boards in the building are not full. Based on the scope and scale of the renovations it would be feasible to reuse the existing electrical distribution equipment.

LANDSCAPE/CIVIL

Selective Site Demolition
Install erosion control measures and safety fencing as required. Obtain Dig-Safe authorization. Conform to requirements of local utilities for discontinuance of existing utilities, if any. Remove existing pavements, utilities, drainage systems, sewer systems and other items as noted to be removed to permit construction. Provide protection for items noted to remain. Relocate existing monuments, statues and memorial signage.

Site Clearing
Install erosion control measures as needed, to include temporary diversion trenches, silt sacks in existing catch basins on and off-site, hay bales and straw waddles and snow fence to protect wetland areas. Conform to requirements of local Conservation Commission, if any. Clear and grub any vegetation, roots or stumps. Provide protection for vegetated areas to remain, areas which are to be cleared and remain un-stabilized for more than 90 days shall be covered or planted as a means of temporary stabilization.

Earth Moving
Perform excavation, grading, filling, backfilling, compacting and preparing grades for entire project, general and trench excavation and backfill for foundation, drainage basins, compensatory storage areas, sewer system, water utilities gas and other utilities, below grade-tanks, concrete slabs-on-grade and other site improvements. Provide structural fill under footings, concrete floors and slabs, crushed stone for storm water control, construction of storm water detention facilities. Provide and install sand bedding materials for buried utilities and provide and install concrete encasement of buried utilities, as required. General and rough grading to obtain finished grades; removal of unsatisfactory soils and their replacement. Ledge, rock and boulder removal, if any.

Erosion and Sedimentation Control
Conform to requirements of local Conservation Commission, if any. Install stone entry to prevent tracking onto adjacent roadways. Contractor is responsible for filing and obtaining NPDES permit prior to the initiation of any site disturbance.

Site Improvements
Provide 40’ flag poles, granite & steel bollards for access control. All fencing is to be 4’ or 8’ high PVC coated black vinyl chain linked fence. Ornamental fence to be 4’ high industrial grade. Steel picket fence with automatic sliding cantilevered gates and controls.

Asphalt Paving
Complete preparation of sub-grade; installation and preparation of gravel base course; installation of hot-mix asphalt pavement; asphalt curbing (cape cod-type), application of pavement markings. Areas subject to heavy truck traffic, such as driveways in front of sallyport bays shall receive heavy duty pavement.

Concrete Paving
Complete the preparation of the sub-grade, installation and preparation of gravel base course, installation of cement concrete pavement, jointing and finishing. Provide as part of the site package, the painted, welded steel handicap ramp railings from park lot to front door.

Segmental Block Retaining Walls (if needed)
Prepare sub-grade, install segmental block walls, with porous back-up and sub-surface drainage.

Stone Curbs
Prepare grades and install granite curbs at parking area at all driveway flares with Center Street.

Wood Guide Rail Fences
Installation of highway quality wood rails for traffic safety and control.

Common Work Results for Utilities
Basic requirements for piping materials and methods. Contractor to install, excavate, utility pipe/ conduit installation, concrete encasement, as needed and backfilling to within 10 ft. from Building. Utility systems to be installed includes domestic water service and separate fire line more than 10 off the building face. Install gas and buried electrical and communications conduits.

Sewer System
The sewer system shall be in conformance with the Town of Burlington Department of Public Works Street Opening / Utility Connection Rules & Regulations. Prior to construction, the Contractor must obtain a Utility / Street Opening Permit through the Engineering Department. Only licensed Utility Contractors will be issued a permit. Although there is an existing sewer system on site, it is assumed that a complete replacement will be required to within 10 feet of the building's foundation. A cleanout is required 10 feet from the foundation. Sewer pipe shall be 6-inch (min.) PVC SDR 35. Precast sewer manholes shall be coated with a waterproofing agent or similar. Manhole castings shall be American made and Neenah Foundry R-1720, East Jordan Iron Works 00211211 (frame) and 00211044CO1 (cover), or approved equal. Prior to operation, the Contractor shall dewater and test the sewer (pipe and manholes) for leakage in accordance with the Rules & Regulations.

Site Utilities
The domestic and fire protection water services shall be in conformance with the Town of Burlington Department of Public Works Street Opening / Utility Connection Rules & Regulations. Prior to construction, the Contractor must obtain a Utility / Street Opening Permit through the Engineering Department. Only licensed Utility Contractors will be issued a permit. Although there is an existing water system on site, it is assumed that a complete replacement will be required to within 10 feet of the building's foundation. All new water services shall be 1-inch (min.) copper. A direct tap corporation adaptor (Pack Joint Coupling Ford C16-33 or approved equal) may be used to connect to the existing water main. All water service corporations, curb-stops, and fittings shall be Mueller or approved equal. The fire protection system must be protected with an approved backflow device.
Coordinate with the local gas utility company for the extension of natural gas from Main Street to the building. Provide trenching, bedding, concrete encasement and backfilling for all buried electrical, communications, CATV and related utilities.

Coordinate with Electrical and related trades. All below grade electrical and communications conduits shall be sealed to prevent water penetration.

Subsurface Soil Conditions
The USDA Natural Resources Conservation Service Web Soil Survey was reviewed for the site. The site is identified as Urban Land (602 grey, in the image below), which is most likely fill and, therefore, has a wide variety of conditions and properties, with no assumed hydrologic soil group provided. Adjacent to the site are soils classified as Paxton-Urban Land Complex, 3-15% slopes (622C blue, in the image below), with a typical soil profile of fine sandy loam and hydrologic soil group of C. Test pits are recommended to field verify the subsurface soil conditions.

Storm Water Drainage System
A new closed drainage system will be required and shall be in conformance with the Town of Burlington Department of Public Works Street Opening / Utility Connection Rules & Regulations. The system will include precast concrete catchment structures, treatment structures, and piping. All drain lines shall be Reinforced Concrete Pipe Class IV. Catch basin castings shall be American made and Neenah Foundry 3589-A, or approved equal, and manhole castings shall be as noted in Sewer System above. Water quality treatment structures shall be Stormceptor hydrodynamic separators manufactured by Rinker Materials.

The proposed conceptual design approximates an additional 17,000(+/-) square feet of impervious area that must be mitigated with stormwater infiltration best management practices. Utilizing available online soil data, and absent subsurface investigations to verify actual field conditions, it is anticipated that the stormwater can be managed with surface infiltration basin(s) with precast concrete outlet device(s) that connect to the municipal system on either Center Street or Sears Street.

Roof Runoff
Roof runoff shall be collected in a subsurface perimeter piping system comprised of Sch 40 PVC pipe, with cleanouts at 100 foot intervals and at all bends, that discharges into the new closed drainage system.

Subdrainage
Install drainage system Sch 40 PVC with cleanouts at 100' intervals and at all bends. It shall be provided at the perimeter of the building and discharge to site drainage system.

Site Lighting
All site and pedestrian lighting are to be LED and dark sky compliant.

ARCHITECTURE

General
The new Burlington Police Station building is sited to face Center Street, a roadway that helps define the Town common. This presents the public 'face' of the building to the street and provides both direct access to Center Street for both the Police and primary access for the public to the Police Station. Police staff will enter the building from a the rear of the building. Staff parking is available behind the building at grade from a secured parking area with access controlled sliding gates.

The publicly accessed spaces, such as the main Lobby and Community Room, are located on the front of the building. This provides easy and efficient access for the public. Secure police functions, such as the detention area, are located at the rear of the building away from direct public view and access.

Construction Exterior
The building is two stories above grade and a partial lower level that is accessible from the two stairs and elevator. The construction type will be 2B and consist of a steel skeletal frame. The framing system allows areas of glass for daylighting and views. The exterior skin is a combination of materials: cementitious siding, PVC trim, fiberglass double hung windows and aluminum curtain wall, backed up by light gauge steel studs (office areas) and 8" cmu (detention/sallyport areas). Building envelope (exterior walls and roof) will conform to the

current State of Massachusetts stretch energy code requirements. Exterior doors and frames will be fiberglass or aluminum in curtain wall frames.

Construction Interior
Interior walls will be full height 6" metal studs at 16" o.c. with gypsum wall board on both sides. Ceilings will be suspended 2'x4' acoustical type and security 2'x4' or steel plank in the detention areas.

Roofing
Slope roofing consisting of architectural asphalt shingles on 1 layer of breathable synthetic underlayment on vented nail base composite deck consisting of 3/4" plywood on 1.5"x2"x3' max. Wood spacers @ 12" o.c. on 3-1/2" rigid polyisocynurate insulation (R-30) on separate layer of 1" rigid iso insulation on vapor retarder on sloped wood deck. All roofing will be specified for a 30 year warranty.

Interior Finishes
Interior finishes will be specified to be durable and sustainable. Paint and sealers for walls, ceilings, and floors will comply with LEED VOC limitations. Walls will be finished with durable materials like painted concrete blocks in the detention area and abuse resistant drywall throughout the office spaces. Refer to attached finishes floor plans for limits of specific finishes.

FIRE PROTECTION
The following is the Fire Protection system narrative, which defines the scope of work and capacities of the Fire Protection system, as well as, the Basis of Design.

1. **Codes**
   A. All work installed under Section 210000 shall comply with the MA Building Code and all state, county, and federal codes, laws, statutes, and authorities having jurisdiction.

2. **Design Intent**
   A. All work is new and consists of furnishing all materials, equipment, labor, transportation, facilities, and all operations and adjustments required for the complete and operating installation of the Fire Protection work and all items incidental thereto, including commissioning and testing.

3. **General**
   A. In accordance with the provisions of the Massachusetts General Law, a commercial building of greater than 7,500 s.f. must be protected with an automatic sprinkler system.

4. **Description**
   A. The new building will be served by a new 6- inch fire service, double check valve assembly, wet alarm valve complete with electric bell, and fire department connection meeting local thread standards.
   B. The system will be a combined standpipe/sprinkler system with control valve assemblies to limit the sprinkler area controlled to less than 52,000 s.f. as required by NFPA 13-2013. A total of four (4) sprinkler zones will be provided: Basement Level, Main Level, Detention Area, and Upper Level.

C. Control valve assemblies shall consist of a supervised shutoff valve, check valve, flow switch and test connection with drain. Standpipes meeting the requirements of NFPA 14-2013 shall be provided in the egress stairwells and in the Stage area.
D. All areas of the building, including all finished and unfinished spaces, combustible concealed spaces, all electrical rooms and closets will be sprinklered.
E. All sprinkler heads will be quick response, pendent in hung ceiling areas and upright in unfinished areas.
F. Fire department valves and cabinets will be provided in each egress stairwell.

5. Basis of Design

A. The mechanical rooms and storage rooms are considered Ordinary Hazard Group 1. Sallyport is considered Ordinary Hazard Group 2. All other areas are considered light hazard.
B. Required Design Densities:
Light Hazard Areas = 0.10 GPM over 1,500 s.f.
Ordinary Hazard Group 1 = 0.15 GPM over 1,500 s.f.
Ordinary Hazard Group 2 = 0.20 GPM over 1,500 s.f.
C. Sprinkler spacing (max.):
Light Hazard Areas = 225 s.f.
Ordinary Hazard Areas = 130 s.f.
D. A hydrant flow test must be performed to confirm the Municipal water supply capacity.

6. Double Check Valve Assembly

A. Double check valve assembly shall be MA State approved, U.L./F.M. approved, with iron body bronze mounted construction complete with supervised OS & Y gate valves and test cocks. Furnish two spare sets of gaskets and repair kits.
B. Double check valve detector assembly shall be of one of the following:
1. Watts Series 757-OSY
2. Wilkins 350A-OSY
3. Conbraco Series 4S-100
4. Or equal

7. Piping

A. Sprinkler piping 1-1/2 in. and smaller shall be ASTM A-53, Schedule 40 black steel pipe. Sprinkler/standpipe piping 2 in. and larger shall be ASTM A-135, Schedule 10 black steel pipe.

8. Fittings

A. Fittings on fire service piping, 2 in. and larger, shall be Victaulic Fire Lock Ductile Iron Fittings conforming to ASTM A-536 with integral grooved shoulder and back stop lugs and grooved ends for use with Style 009-EZ or Style 005 couplings. Branch line fittings shall be welded or shall be Victaulic 920/920N Mechanical Tees. Schedule 10 pipe shall be roll grooved. Schedule 40 pipe, where used with mechanical couplings, shall be roll grooved and shall be threaded where used with screwed fittings. Fittings for threaded piping shall be malleable iron screwed sprinkler fittings.

9. Joints

A. Threaded pipe joints shall have an approved thread compound applied on male threads only. Teflon tape shall be used for threads on sprinkler heads. Joints on piping, 2 in. and larger, shall be made up with Victaulic, or equal, Fire Lock Style 005, rigid coupling of ductile iron and pressure responsive gasket system for wet sprinkler system as recommended by manufacturer.

10. Sprinklers

A. All sprinklers to be used on this project shall be Quick Response type.
B. Furnish spare heads of each type installed located in a cabinet along with special sprinkler wrenches. The number of spares and location of cabinet shall be in complete accord with NFPA 13-2013.
C. Sprinklers shall be manufactured by Tyco, Victaulic, Viking, or equal.
D. Upright sprinkler heads in areas with no ceilings shall be Tyco Model "TY-FRB" Quick Response, upright natural brass finish heads. Include heavy duty sprinkler guards in all mechanical rooms and storage rooms.
E. Sidewall heads shall be Tyco Model "TY-FRB" Quick Response with white polyester head and escutcheon.
F. Pendent wet sprinkler heads shall be Tyco Model "TY-FRB" Quick Response recessed adjustable escutcheon, white polyester finish.
G. Concealed heads shall be Tyco Model "RFII" Quick Response concealed type, 1-1/2 inch adjustment white cover plate. In special areas, as may be noted on the Drawings, provide alternate cover plate finishes.
H. Use of flexible stainless steel hose with fittings for fire protection service that connect sprinklers to branch lines in suspended ceilings is acceptable. Flexible hoses shall be UL/FM approved and shall comply with NFPA 13 standards. Hose assemblies shall be type 304 stainless steel with minimum 1-inch true-bore internal hose diameter. Ceiling bracket shall be galvanized steel and include multi-port style self-securing integrated snap-on clip ends that attach directly to the ceiling with tamper resistant screws.

PLUMBING

The following is the Plumbing system narrative, which defines the scope of work and capacities of the Plumbing system as well as the Basis of Design.

1. Codes

A. All work installed under Section 220000 shall comply with the MA Building Code, MA Plumbing Code and all state, county, and federal codes, laws, statutes, and authorities having jurisdiction.

2. Design Intent

A. All work is new and consists of furnishing all materials, equipment, labor, transportation, facilities, and all operations and adjustments required for the complete and operating installation of the Plumbing work and all items incidental thereto, including commissioning and testing.

3. General

A. The Plumbing Systems that will serve the project are cold water, hot water, tempered water, sanitary waste and vent system, garage waste system, and storm drain system.
B. The building will be serviced by Municipal water and Municipal sewer system.
C. All Plumbing in the building will conform to Accessibility Codes and to Water Conserving sections of the Plumbing Code.

4. Drainage System

A. Soil, Waste, and Vent piping system is provided to connect to all fixtures and equipment. The system runs from 10 feet outside the building and terminates with stack vents through the roof.
B. A separate Garage Waste System starting with connection to an exterior concrete gas/oil separator running through the Sallyport garage floor drains and terminating with a vent terminal through the roof. The exterior gas/oil separator shall be provided by Division 22.

C. Storm Drainage system is provided to drain all flat roofs with roof drains piped through the building to a point 10 feet outside the building.
D. Drainage system piping will be service weight cast iron piping; hub and spigot with gaskets for below grade; no hub with gaskets, bands and clamps for above grade 2 in. and larger. Waste and vent piping 1-1/2 in. and smaller will be type 'L' copper.

5. Water System

A. A new 2-inch domestic water service from the municipal water system will be provided. A meter and backflow preventer will be provided.
B. Cold water distribution main is provided. Non-freeze wall hydrants with integral back flow preventers are provided along the exterior of the building.
C. Domestic hot water heating will be provided with a tank type electric water heater; 36 kW element with 250 gallons of storage. System is to be equipped with thermostatically controlled mixing devices to control water temperature to the fixtures. A pump will re-circulate hot water from the piping system. The water temperature will be 120 deg. to serve general use fixtures.
D. Water piping will be type 'L' copper with wrot copper sweat fittings, silver solder or press-fit system. All piping will be insulated with 1 in. thick high-density fiberglass.
E. Tepid (70 deg. F – 90 deg. F) water will be provided to the emergency shower/eyewash fixtures in Science Classrooms as required by code.

6. Fixtures

A. Furnish and install all fixtures, including supports, connections, fittings, and any incidentals to make a complete installation.
B. Fixtures shall bear the manufacturer's guaranteed label trademark indicating first quality. All acid resisting enameled ware shall bear the manufacturer's symbol signifying acid resisting material.
C. Vitreous china and acid resisting enameled fixtures, including stops, supplies and traps shall be of one manufacturer by Kohler, American Standard, or Eljer, or equal. Supports shall be Zurn, Smith, Josam, or equal. All fixtures shall be white. Faucets shall be Speakman, Chicago, or equal.
D. Fixtures shall be as scheduled on drawings.
    1. Water Closet: High efficiency toilet, 1.28 gallon per flush, wall hung, vitreous china, siphon jet. Manually operated 1.28 gallon per flush-flush valve.
    2. Penal Combi Toilet: Acorn Model 1418-FA-AL/AR-2-BP-4-1.6GPF-M-PBH-SPS-SW, suicide skirt, 18" wide lav/toilet, penal fixture combination, fabricated of type 304, #14 gage Stainless steel, seamless welded construction. Fixture is supplied with domestic hot and cold water.
    3. Penal Combi ADA Toilet: Acorn Model No. 1432-ADA-AL/AR-2-DMS-4-1.6GPF-PBH-SPS-SW with rear spud, floor mounted wall outlet blowout jet stainless steel institutional water closet less grab bar, elongated bowl, integral stainless-steel seat, suicide skirt, seamless construction, complete with vandal proof mounting hardware. Fixture is supplied with domestic hot and cold water.
    4. Urinal: High efficiency 0.13 gallon per flush urinal, wall hung, vitreous china. Manually operated 0.13 gallon per flush-flush valve.
    5. Lavatory: Wall hung/countertop ADA lavatory with 0.5 GPM metering mixing faucet.
    6. Sink: MAAB/ADA stainless steel countertop sink with gooseneck faucet and 0.5 GPM aerator.
    7. Fountain: Barrier free hi-low wall mounted electric water cooler, stainless steel basin with bottle filling stations.
    8. Janitor Sink: 24 x 24 x 10 Terrazo mop receptor Stern-Williams or equal.

9. : Aquatic Bath Model 48-ACS acrylic shower stall or Aquatic Bath 6036-BSFCMA barrier free acrylic shower stall with integral soap shelf and seat. Center drain location and slip resistant, textured bottom. Symmons Safetymix shower trim, concealed pressure balanced shower valve with lever handle, integral checkstops, factory pre-set temperature limit stops, 2.5 GPM flow restrictor.
10. Detention Area Hose Bibb: Acorn Series 8109 hot and cold water hose bibb, cast bronze valve body, vacuum breaker, screw driver stops, recessed stainless steel mounting box with locking door.

7. Drains

A. Drains are cast iron, caulked outlets, nickaloy strainers, and in waterproofed areas and roofs shall have galvanized iron clamping rings with 6 lb. lead flashings to bond 9 in. in all directions. Drains shall be Smith, Zurn, Josam, or equal.

8. Valves

A. Locate all valves so as to isolate all parts of the system. Shutoff valves 3 in. and smaller shall be ball valves, solder end or screwed, Apollo, or equal.

9. Insulation

A. All water piping shall be insulated with snap-on fiberglass insulation Type ASJ-SSL, equal to Johns Manville Micro-Lok HP.

10. Cleanouts

A. Cleanouts shall be full size up to 4 in. threaded bronze plugs located as indicated on the drawings and/or where required in soil and waste pipes.

11. Access Doors

A. Furnish access doors for access to all concealed parts of the plumbing system that require accessibility. Coordinate types and locations with the Architect.

H.V.A.C

The following is the HVAC Systems narrative, which defines the proposed scope of work and capacities of the HVAC Systems, as well as the Basis of Design.

1. Codes

All work installed under Section 230000 shall comply with the Massachusetts State Building Code and all state, county, and federal codes, laws, statutes, and authorities having jurisdiction.

2. Design Intent

All work is new and consists of furnishing all materials, equipment, labor, transportation, facilities, and all operations and adjustments required for the complete and operating installation of the Mechanical work and all items incidental thereto, including commissioning and testing.

3. Mechanical System Life Cycle Analysis

As part of the schematic design phase, a building energy model will be prepared and a life cycle cost analysis shall be performed to determine the most cost-effective HVAC system for the building in terms of overall life cycle cost that factor in first, operating, maintenance and replacement costs of different HVAC system options. The following options are proposed to be studied in comparison to Baseline Code HVAC systems.

4. Baseline (Fossil Fuel Free – Electric Heating) HVAC System

The following HVAC system represents the ASHRAE 90.1-2019 Electric Heating Baseline System consisting of the following features.

A. Air Handling Systems: Multiple air handling units shall be provided to serve the different building zones as described below. AHUs could be either roof mounted packed direct expansion (DX) electric cooling and heat pump units or indoor units equipped with split air- cooled heat pump condensing units located on the roof. All air handling units shall be equipped with supply air fans with VFDs, supplemental electric heating, DX heat pump cooling/heating sections, and MERV-14 filters. Energy recovery ventilation shall be provided for AHUs with large outdoor air requirements in which energy recovery is code required. AHUs shall be capable of variable air volume operation and shall deliver heated air-conditioned supply air (with percentage of outdoor ventilation air meeting the minimum ventilation code requirements) to the building areas via an insulated overhead galvanized sheetmetal ductwork distribution system equipped with terminal VAV (variable air volume) boxes with electric heating coils. A combination of electric resistance type radiation, radiant panels, convectors and unit heaters shall be provided for heating only areas. It is estimated that HVAC air handling equipment with the following capacities shall be required:

1) The Police Station Administration areas, Training/Meeting Room, and Office areas shall be served by air handling unit systems with a combined capacity of approximately 30,000 CFM.
2) The Processing and Cell Block area shall be provided with an energy recovery air handling unit, with an estimated capacity of 2,000 CFM.
3) The air handling units (AHUs) will be provided with MERV 14 filters, DX cooling coils, supply and exhaust fans with variable frequency drives, supplemental electric heating, and energy recovery wheels (where code required). The units will provide conditioned supply air to each space through a fiberglass-insulated galvanized sheet-metal distribution system. Return air from each space will be returned through a separate galvanized sheet-metal return air system back to the air handling units where it will be filtered, heated or air conditioned and re-circulated to the supply airstream.
4) The AHUs' supply air distribution system will consist of overhead insulated galvanized sheetmetal distribution system equipped with variable air volume terminal boxes with electric reheat coils and sound attenuators. The VAV boxes will vary the supply airflow based on the zones' temperature and ventilation requirements. CO2 demand ventilation controls shall be provided for AHU systems where code required (such as large meeting rooms with high anticipated occupant densities).

B. Sallyport:

1) The Sallyport area of the building shall be provided with electric unit heaters. The Sallyport shall be provided with a vehicle source-capture exhaust system and general exhaust air systems with gas monitoring controls.

C. Supplemental Air Conditioning Systems:

1) The IT Head End Server Room shall be equipped with a dedicated split heat pump AC system that will provide the cooling needs for the space. It is estimated that two (2) 3 ton computer room AC units shall be required to serve the IT Head End Room.
2) Elevator machine room shall be served by a 1.5 ton ductless split AC unit.

D. Exhaust Systems: Building general, custodial closets, utility room and specialty exhaust air systems shall be provided.

E. Automatic Temperature Controls (DDC): Automatic Temperature Controls will be of the low-voltage direct digital control (DDC) design for the operation of all HVAC equipment, input sensors, and valve/damper actuators. A central communication network will be provided for the monitoring of all space temperatures, system set points, and overall control for the entire HVAC system. A central front-end workstation PC will also be provided as a user interface for access to the entire automatic temperature control (ATC) system. The ATC control system shall be web accessible and shall be capable of being integrated into a Town Wide building energy management system.

5. HVAC System - Option 1 – Air Source Hydronic Heat Pump & Fan Coil Unit System

A. Summary: Under this option, an air source heat recovery chiller shall be provided, which will provide heating hot water and chilled water throughout the building. Occupied spaces shall be heated/cooled by space mounted fan coil units. Ventilation air will be provided by roof- mounted air handling units that shall be ducted to each fan coil unit through a central distribution system to deliver 100% outside air to each space. Hot water and chilled water shall be distributed by end suction pumps equipped with VFDs. Automatic temperature controls will be of the direct digital low-voltage type communicating with all HVAC equipment.

B. Heating and Cooling Plants:
   1) A modular air source heat recovery chiller plant shall be provided, which shall be capable of providing hot and chilled water simultaneously. It is estimated that the plant shall consist of six (6) 30-ton modules for a total plant load of 180 tons. One module shall be redundant. The hot and chilled water systems will include propylene glycol at a concentration of approximately 30% by weight to prevent freezing.
   2) A maximum of 130°F heating hot water will be distributed to rooftop units and terminal heating equipment throughout the building through a fiberglass-insulated steel/copper distribution system by primary and standby pad-mounted pumps equipped with variable frequency drives. The supply water temperature shall be adjusted downward based on outdoor air temperature.
   3) A backup electric boiler shall be provided, which shall operate only upon a failure of the air source heat pump chiller. It is estimated that the boiler shall be sized for 300 kW.
   4) Chilled water will be distributed to the various rooftop air handling units at 44°F (adj.) through a fiberglass insulated copper distribution system, which will include primary and standby pad-mounted circulator pumps. A compensated chilled water loop shall be provided to distribute chilled water throughout the building to the various fan coil units at 55°F through a fiberglass insulated copper distribution system. The compensated chilled water loop shall include primary and standby pad-mounted circulator pumps equipped with variable frequency drives.

C. Ventilation System:
   1) The central ventilation system will include air handling units of the 100% outside air design. The air handling units will be provided with MERV 14 filters, chilled water cooling coils with modulating control valve, hot water heating coils with modulating control valve, supply and exhaust fan with variable frequency drives, total energy recovery wheel, and a hot water re-heat coil for dehumidification reheat purposes. The units will provide ventilation air to each induction unit through a fiberglass insulated galvanized sheet-metal distribution system. 100% of the supply air to each space will be returned through a separate galvanized sheet-metal return air system back to the air handling units where it will pass through an energy recovery wheel which will transfer heat from the exhaust air stream to the outside air intake

stream for pre-heating and vice-versa for pre-cooling. It is estimated that units with the following capacities shall be required:

a. The Police Station Administration areas, Training/Meeting Room, and Office areas shall be served by a rooftop air handling unit (RTU-1) with an estimated capacity of 12,000 CFM, 391 MBH heating and 50 tons cooling.
b. The Processing and Cell Block area shall be provided with an energy recovery air handling unit, with an estimated capacity of 2,000 CFM, 55 MBH heating and 10 tons cooling.

The RTUs' supply air distribution system will consist of overhead insulated galvanized sheetmetal distribution system. Densely occupied spaces shall be provided with variable air volume (VAV) boxes with sound attenuators. The VAV boxes will vary the supply airflow based on the zones' ventilation requirements.

D. Toilet and Shower Rooms
1) Toilet areas and shower areas will be ducted to the return ductwork of the associated RTU, where it will pass through the energy recovery wheel before it is exhausted to the outdoors. Aluminum exhaust ductwork and grilles will be provided for shower areas.
2) Perimeter ceiling-mounted hot water radiant panels will provide supplemental heating.

E. Supplemental Air Conditioning Systems:
1) Under this option, Electrical Rooms and IDF/MDF/Server rooms shall be served by ducted fan coil units equipped with hot water and chilled water coils, which will provide the cooling needs for the space. It is estimated that (5) 18 MBH fan coil units shall be required to serve the Electrical rooms and Server room.
2) The elevator machine room shall be served by an 18 MBH ducted fan coil unit.

F. Exhaust Systems: Exhaust air fans systems shall be provided for custodial closets, locker room, toilet room, utility room and specialty exhaust air systems. A commercial kitchen exhaust air fan system shall be provided for the kitchen.

G. Sallyport:
1) The Sallyport area of the building shall be provided with hot water unit heaters. The Sallyport shall be provided with a vehicle source-capture exhaust system and general exhaust air systems with gas monitoring controls.

H. Automatic Temperature Controls (DDC): Automatic Temperature Controls will be of the low-voltage direct digital control (DDC) design for the operation of all HVAC equipment, input sensors, and valve/damper actuators. A central communication network will be provided for the monitoring of all space temperatures, system set points, and overall control for the entire HVAC system. A central front-end workstation PC will also be provided as a user interface for access to the entire automatic temperature control (ATC) system. The ATC control system shall be web accessible and shall be capable of being integrated into a Town Wide building energy management system.

6. HVAC System Option 2 – Air Source VRF (Variable Refrigerant Flow) System

A. Summary:
1) Under this option, a high-efficiency Air Source Variable Refrigerant Flow (VRF) heat recovery system shall provide simultaneous heating and cooling capabilities to all regularly

occupied spaces via a combination of ducted, ductless wall and/or ductless ceiling cassette type VRF terminal heating and cooling units. Air conditioning will be generated by outdoor roof or grade mounted heat recovery type air source heat pump condensing units that shall be connected to the VRF indoor heating and cooling units. The outdoor VRF heat pump condensing units will be sized and located according to terminal equipment zones capacity requirements and VRF system piping length limitations.

2) It is estimated that a combined total capacity for the outdoor air-cooled heat recovery heat pump condensing unit shall be approximately 80 tons to serve the terminal indoor VRF units.
3) Ventilation shall be provided to building areas via dedicated outdoor air systems (DOAS) air handling units as described below. Rooftop air handling units shall be provided with packaged heat pump units heating/cooling section.
4) Heating for entryways, stairwells and storage rooms will be generated by a combination of electric resistance type unit heaters, radiant panels and fin tube radiation.

B. Ventilation System: The ventilation system shall include rooftop air handling units of the 100% outside air dedicated outdoor air system (DOAS) design. The DOAS units shall be provided with MERV 14 filters, packaged heat pump cooling/heating coil, supply and exhaust fans with variable frequency drives or EC motors, supplemental electric heating coils, total energy recovery wheel, and hot gas re-heat coil for dehumidification reheat. The DOAS units shall provide ventilation air to each occupied building area through a fiberglass insulated galvanized sheet-metal distribution system. Airflow from each space will be returned through a separate galvanized sheet-metal return air system back to the air handling units where it will pass through an energy recovery wheel which will transfer heat from the exhaust air stream to the outside air intake stream for preheating or vice-versa for pre- cooling. Densely occupied spaces such as the training room shall be provided with variable air volume terminal boxes equipped with CO2 demand ventilation controls that will control the amount of ventilation airflow to the space. The units will operate at reduced capacity during the unoccupied periods if unoccupied space set points are not maintained. It is estimated that units with the following capacities shall be required:
   1) The Police Station Administration areas, Training/Meeting Room, and Office areas shall be served by a rooftop air handling unit (RTU-1) with an estimated capacity of 12,000 CFM, 391 MBH heating and 50 tons cooling.
   2) The Processing and Cell Block area shall be provided with an energy recovery air handling unit, with an estimated capacity of 2,000 CFM, 55 MBH heating and 10 tons cooling.

The RTUs' supply air distribution system will consist of overhead insulated galvanized sheetmetal distribution system. Densely occupied spaces shall be provided with variable air volume (VAV) boxes with sound attenuators. The VAV boxes will vary the supply airflow based on the zones' ventilation requirements.

C. Locker, Toilet, Shower Rooms:
   1) Toilet areas and shower areas will be ducted to the return ductwork of the associated RTU, where it will pass through the energy recovery wheel before it is exhausted to the outdoors. Aluminum exhaust ductwork and grilles will be provided for shower areas.
   2) Perimeter ceiling-mounted electric radiant panels will provide supplemental heating.

D. Supplemental Air Conditioning Systems:
   1) Under this option, Electrical Rooms and IDF/MDF/Server rooms shall be served by dedicated ductless split AC systems which will provide the cooling needs for the space. It is estimated that (5) 18 MBH DCUs shall be required to serve the Electrical rooms and Server room.
   2) The elevator machine room shall be served by an 18 MBH ductless split AC system.

E. Exhaust Systems: Exhaust air fans systems shall be provided for custodial closets, utility room and specialty exhaust air systems. A commercial kitchen exhaust air fan system shall be provided for the kitchen.

F. Sallyport:
   1) The Sallyport area of the building shall be provided with VRF evaporators to provide heating. The Sallyport shall be provided with a vehicle source-capture exhaust system and general exhaust air systems with gas monitoring controls.

G. Automatic Temperature Controls (DDC): Automatic Temperature Controls will be of the low-voltage direct digital control (DDC) design for the operation of all HVAC equipment, input sensors, and valve/damper actuators. A central communication network will be provided for the monitoring of all space temperatures, system set points, and overall control for the entire HVAC system. A central front-end workstation PC will also be provided as a user interface for access to the entire automatic temperature control (ATC) system. The ATC control system shall be web accessible and shall be capable of being integrated into a Town Wide building energy management system.

7. HVAC System – Option 3 – Ground Source VRF System

Summary: The building HVAC distribution system for this option shall be similar to Option 2 VRF system, with the following differences:

A. Heating and Cooling Plant: The Option 2 high efficiency air source outdoor heat pump condenser units described above shall be replaced with groundwater source cooled heat recovery heat pump equipment.

B. Groundwater source heat pump heating/cooling rooftop units shall be provided in lieu of the air source heat pump rooftop units described above.

C. The air source heat recovery VRF condensing units described above shall be replaced by groundwater source heat recovery condensing units of the same capacity. Ground water shall be distributed between the wellfield and water source VRF heat pump units, and refrigerant piping shall be distributed between the water source VRF heat pumps and the indoor VRF air handling equipment.

D. A groundwater source heat pump water heater shall be added, which will provide heating hot water to radiant panels, unit heaters, and the hot water radiant floor heating system.

E. All electric resistance heating equipment described in option 2 shall be replaced with heating hot water equipment (radiant panels, radiant floor heating in Apparatus bay, unit heaters, etc.)

F. Ground source water shall be distributed to the RTUs, the groundwater source heat pump water heater, and VRF heat pump equipment from a closed loop geothermal well field. Ground source water shall be distributed to the equipment via a (2) groundwater pumps system piped in a primary/standby configuration. All pumps shall be equipped with variable speed drives or EC motors. Ground water source side hydronic accessories including expansion tank, filter and an air separator shall be provided. The equipment shall be located in a mechanical room located on the first floor level.

G. The ground source well field shall consist of approximately twenty-five (25) 650 ft deep vertical close loop wells constructed of quad-loop HDPX piping. Lateral piping shall be constructed of HDPE piping. Each well shall require a capacity of approximately 4 tons each. Well field quantity and depths are estimates only. Actual well field quantity, depth and capacity of wells shall be determined by Ground Source Wellfield Consultant.

8. Testing, Adjustment, and Balancing Requirements

A. The mechanical contractor shall provide testing of the following systems with the owner and owner's representative present:
   1) Air Source or Geothermal plant system
   2) Geothermal, Air Source, or VRF heat pump condensing unit plant system
   3) Hot water booster heat exchanger system
   4) Indoor Air Handling Units
   5) Terminal heating and cooling devices
   6) Automatic temperature control and building energy management system

B. Testing reports shall be submitted to the engineer for review and approval before providing to the owner.

9. Operation Manuals and Maintenance Manuals

When the project is completed, the mechanical contractor shall provide operation and maintenance manuals to the owner.

10. Record Drawings and Control Documents

When the project is completed, an as-built set of drawings, showing all mechanical system requirements from the contract and addendum items will be provided to the owner.

11. Commissioning

The project shall be commissioned per the project Commissioning Agent's (CxA) specifications.

ELECTRICAL

The following is the Electrical Systems narrative, which defines the scope of work and capacities of the Power and Lighting systems, as well as the Basis of Design.

1. Codes

All work installed under Section 26 00 00 shall comply with the Massachusetts State Building Code and all state, county, and federal codes, laws, statutes, and authorities having jurisdiction.

2. Design Intent

All work is new and consists of furnishing all materials, equipment, labor, transportation, facilities, and all operations and adjustments required for the complete and operating installation of the Electrical work and all items incidental thereto, including commissioning and testing.

Energy Efficiency: Lighting system shall be designed and installed in accordance with IECC 2020 requirements.

A. Power Distribution:

1) Electrical power will be brought into the site via underground medium voltage cables from the utility company network. A pad mounted step-down transformer will be located at grade adjacent to the building. Service entrance and distribution switchgear will be located in the electrical room along with lighting and power distribution panels. The service capacity will be sized for 1,000 amperes at 277/480V, 3Ø, 4 wire.
2) A 450kW, 562.5kVA, 277/480V, 3Ø, 4W diesel fired emergency generator will be provided and include automatic starting and safety controls. The unit will be housed outdoors on a concrete pad. The generator will include three (3) service breakers: one (1) for life safety equipment, one (1) for optional standby equipment, and one (1) for the load bank.
3) The generator will be sized for 100% of all lighting and power loads, including air conditioning and heating.
4) The emergency power distribution system will consist of two automatic transfer switches, one 100 ampere for life safety equipment and one 1000 ampere for optional stand-by systems. A separate system of distribution panels and conduit systems will be provided for each level of emergency power as required by code. A kirk key interlock system will be provided for a roll up back-up generator. A manual transfer switch with kirk key interlock will also be provided for a temporary roll up generator on the life safety system for maintenance of the permanent generator.
5) A centralized uninterruptible power supply (UPS) sized at 15 KVA with 8 minutes of battery back-up will be located in the Head End Room and will back up all critical communications equipment including dispatch and report writing receptacles.

B. Interior Lighting System:

1) General Offices and Meeting Room lighting fixtures will consist of recessed 2'x4' LED luminaries with dimming drivers. The fixtures will be wired for automatic dimming where natural day light is available and also for multi-level switching.
2) Corridors and other functional lighting fixtures will consist of acrylic recessed direct fixtures with LED lamps and electronic drivers.
3) Lighting in Cells will be vandal proof fixtures corner mounted LED. Each Cell will be separately switched. Selected fixtures in Cell areas will have integral emergency ballasts for instant lighting upon power failure.
4) Lighting in the Communications Dispatch Center will be indirect dimmable LED with consideration of LED dimmable down lights over each position.
5) Storage, mechanical, apparatus, etc. will be LED industrial fixtures with acrylic lens.
6) Exit signs will be of the energy efficient, long life LED type.
7) All fixtures will be dimmable LED type.
8) Each area will be locally switched and designed for multi-level controls. Each office space and toilet rooms will have an occupancy sensor to turn lights off when unoccupied. Daylight dimming sensors will be installed in each space with daylight contribution for automatic dimming of light fixtures.
9) The entire facility will be controlled with an automatic lighting control system for programming lights on & off.

C. Site Lighting System:

1) Fixtures for area lighting will be pole mounted LED luminaries in the parking area. The exterior lighting will be connected to the automatic lighting control system for photocell on and timed off operation.
2) Building perimeter fixtures will be wall mounted LED sconces over exterior doors.
3) All fixtures will be of the cut-off type.

D. Lighting Controls:

1) Interior lighting will be controlled by a networked lighting control system (NLCS) utilizing distributed load controllers (switching and dimming) actuated by signals from occupancy/vacancy sensors, daylight sensors, keypads, touchscreens, and auxiliary override inputs from the fire alarm, security, building management (BMS), and emergency power systems; BACnet/IP or contact closure output interfaces will be utilized from each system. Timed schedules following daily facility schedules with overrides will be employed for initial control of all common areas. Lighting will be fed from normal or life safety source panels; refer to item C below.
2) Exterior lighting will be controlled by a networked lighting control system (NLCS) utilizing distributed load controllers or centralized panels (switching+dimming) actuated by signals from occupancy sensors, daylight sensors, keypads, touchscreens, and auxiliary override inputs from the fire alarm, security, building management, and emergency power systems; BACnet/IP or contact closure output interfaces will be utilized from each system. Pole-mounted area lighting will be provided with wireless load controller nodes integrated into each fixture allowing for individual or zoned control. Timed control following dusk-to-dawn schedules with overrides will be employed for initial control of all exterior lighting. Lighting will be fed from normal or life safety source panels; refer to item C below.
3) Designated emergency and egress lighting will be wired to life safety source panels and be controlled by the NLCS when normal utility source power is available and brought to full “ON” through system control UL924 listed by-pass functions when normal utility source power is lost. Emergency exit signage shall be uncontrolled and remain “ON” constantly.

E. Wiring Devices:

1) Offices will generally have one (1) duplex outlet per wall. At each workstation a double duplex receptacle will be provided.
2) Corridors will have a cleaning receptacle at approximately 30-40 foot intervals.
3) Exterior weatherproof receptacles will be installed at exterior doors.
4) A system of computer grade panelboards will double neutrals and surge protective devices will be provided for receptacle circuits.
5) A system of computer grade panelboards with double neutrals and transient voltage surge suppressors will be provided for receptacle circuits.
6) Receptacles in Garage and Sallyport spaces will be GFI type weatherproof covers mounted at 48 inches above floor.
7) Automatic control of receptacles based on occupancy will be provided for at least 50% of the receptacles installed in private offices, open offices, conference rooms, rooms used

primarily for printing and/or copying functions, break rooms, and individual workstations. Controlled receptacles will be marked per NEC 406.3 (E).

F. Fire Alarm System:

1) A fire alarm and detection system will be provided with 60 hour battery back-up. The system will be of the addressable type, where each device will be identified at the control panel and remote annunciator by device type and location to facilitate search for origin of alarms.
2) Smoke detectors will be provided in open areas, corridors, stairwells and other egress ways. Elevator recall will be provided.
3) The sprinkler system will be supervised for water flow and tampering with valves.
4) Horn/strobes will be provided in egress ways, assembly spaces, open areas and other large spaces. Strobe only units will be provided in single toilets and conference rooms.
5) Manual pull stations will be provided at exit discharge personnel doors.
6) The system will be connected to automatically report alarms to the fire department.

G. Distributed Antennae System (DAS):

1) A public safety radio distributed antenna system (DAS) which consists of bi-directional amplifiers (BDA), donor antennas, coverage antennas, coax cable, coax connectors, splitters, combiners and couplers. These devices will be used as part of a system for in-building public safety 2-way radio system communication.

H. Renewable Energy System Provisions:

1) The base project will include Electrical provisions for a roof mounted renewable energy system for a grid connected photovoltaic PV system intended to reduce the facilities demand for power.

I. Level 2 AC Dual Electric Vehicle Charging Equipment (EVSE):

1) Provide three (3) EVSE stations fed with 40 ampere feeders back to the building for charging electric vehicles. Two protective bollards will be installed at each charging station. In addition to the (3) stations, 10% of parking spaces shall be EVSE ready which is defined as a 40 Amper circuit to within 6’ of the charger.

J. Metering:

1) Measurement devices shall be installed to monitor the electrical energy use for each of the following separately:
    a. Total electrical energy
    b. Sub-metering in accordance with ASHRAE 90.1 para. 8.4.3

2) Recording and Reporting:
    a. The electrical energy usage for all loads listed above shall be recorded a minimum of every 15 minutes and reported at least hourly, daily, monthly, and annually. The system shall be capable of maintaining all data collected for a minimum of 36 months.

K. Lightning Protection System:

1) A system of lightning protection devices will be provided.
2) The lightning protection equipment will include air terminals, conductors, conduits, fasteners, connectors and ground rods.
3) The lightning protection system will be provided with a UL master label certificate.

3. Testing Requirements

A. The Electrical Contractor shall provide testing of the following systems with the Owner and Owner's Representative present:

1) Lighting and power panels for correct phase balance.
2) Emergency generator.
3) Lighting control system (interior and exterior).
4) Distributed Antennae System.
5) Fire alarm system.
6) Lightning Protection System.
7) Uninterruptible Power System, UPS.

B. Testing reports shall be submitted to the Engineer for review and approval before providing to the Owner.

4. Operation Manuals and Maintenance Manuals

A. When the project is complete, the Electrical Contractor shall provide operation and maintenance manuals to the Owner. Final affidavits will not be issued until Operation and Maintenance Manuals are issued.

5. Record Drawings and Control Documents

A. When the project is completed, an as-built set of drawings, showing all lighting and power requirements from contract and addendum items will be provided to the Owner.

SECURITY

A. Purpose

The purpose of this document is to define specific security, access control and surveillance requirements for the exterior and interior of the proposed Burlington Police Department. These requirements should be aligned with the existing Burlington Police Department standards.

B. Site Perimeter

Fencing

Perimeter fencing around the police station will encompass the entire site with vehicle control barriers to designate public and private areas of the site. A radio-frequency identification RFID system will be utilized to control the vehicular gate operators to allow private parking of patrol and personal vehicles.

Surveillance

Perimeter surveillance will include high resolution, lowlight and infrared fixed cameras, including 180 and 360 degree cameras in concert with video analytics, including motion detection, to establish a virtual perimeter and monitor activity within the site. Surveillance will be used to cover

the vehicular entrances of the site, visitor and employee parking areas, main and exit only doors. Cameras will be aesthetically mounted to light poles, if required, and the facility, where permitted, in order to provide maximum coverage of the perimeter. All exterior building cameras will be power over Ethernet (PoE), specified for the environment in which they are located and will include lightening and surge protection. All PoE power supplies will be on UPS and emergency power. Pole mounted cameras, if required, will be powered from independent 120VAC power supplies mounted in a NEMA enclosure at the base of the pole.

The benefit of utilizing a PoE solution not only supplies low voltage power rather than high voltage power to these devices, but more importantly provides the means to control power to the device. Central control of the PoE devices allows for devices to be turned on or off based on a predetermined schedule, a sensor, or an event, such as motion detection. The result can be reduced consumption of power to devices, reduced power usage and a greener building. In addition, PoE reduces the use of materials, eliminating the need to provide a power cable to the device.

C. Building Perimeter

The proposed facility has entry doors for visitors and employees, all of which will be controlled by a card reader, door position switch(es) and monitored by surveillance both on the interior and exterior. The visitor entry door and Prisoner Release, will include two-way audio and video communication with dispatch through the use of a video intercom system whereby a visitor would request access into the facility if the exterior door is locked and secure. Master intercom stations, mounted at the desks inside the Dispatch, will be programmed with the functionality to electronically unlock the door exterior if access is granted.

All exterior doors not used for normal entry, but for emergency egress only, will be equipped with hardware only on the interior side of the door, door position switches and audible alarms. Alarms will be generated for unauthorized access and can be silent alarms, generated only on the access control workstation, and/or audible alarms for local annunciation.

D. Building Interior

Access Control

All controlled and monitored doors will communicate with access control panels mounted in a climate-controlled room inside the facility. This location will also house the PoE switches that power the cameras and the video management system server. These panels will transmit the access control data to an access control system, controlled through a workstation, located in Dispatch and, if required, other locations in the facility. The system will have the capability to receive and acknowledge various types of facility alarm conditions to include door-propped-open and door-forced open. For ease in identifying the locations of alarms, all events will be displayed on a facility map indicating the specific location and type of alarm.

Through the access control system and associated door controlling equipment, Dispatch will have the capability to unlock electronically controlled doors as well as lockdown the facility, rendering all card access doors only to be operated by pre-authorized credentials. These panels will also include a fire alarm module to support a connection with the fire alarm system.

The access control system database will be linked to the human resource database, which will

allow new employee data to be passed to the system for pre-population of card holder data, which will allow personnel to quickly create a new access control credentials. Access control credentials will be produced with badging software within, or integrated with, the access control system and allow for multi-colored badges with a photograph and permit full user design of style, logo, fonts and data placement. The system will be part of, or integrated with, the access control system in order to permit tracking of individual badge usage, activation/deactivation of badges at any time or based upon user defined rule sets, and provide both standard and custom reporting capability.

Single authentication card access will be employed at the following locations (see diagram for specific locations and in/out readers):

A. Vestibules
B. Interview Rooms
C. Dispatch
D. IT Storage
E. Testing Area
F. Network Room
G. Lt. Office
H. Workspaces
I. Union
J. Lt. Office
K. Chief
L. Captain Office
M. Deputy Chief
N. Dispatch
O. Patrol Sergeants
P. Patrol Admin
Q. Report Writing
R. Weapons Cleaning
S. Elevator
T. Training Unit
U. Traffic
V. Detail Officer
W. Crime Analyst's Office
X. Training Unit Office
Y. IT Director Office
Z. Stairwells
AA. Union
BB. Admin Assistant
CC. Prisoner Release
DD. Bondsman
EE. Matron
FF. Ready Room
GG. Processing/ Detention
HH. Archives
II. Building Services
JJ. Facilities Management
KK. Meeting
LL. Evidence Lab
MM. Evidence Storage
NN. Records
OO. Mental Health
PP. Mechanical
QQ. Shooting Range
RR. Simulation
SS. Wellness
TT. Supervisor Office
UU. Video Evidence Evaluation
VV. Evidence Detective and Court Officer
WW. Criminal Detectives
XX. Det. Lt. Office
YY. Det. Sergeant Office
ZZ. Captain Office

Dual authentication card access will be employed at the following locations (see diagram for specific locations and in/out readers):

A. Armory
B. Meeting/Kitchenette
C. Interview
D. Sallyport
E. Detention

Video Management System
The video management system will be capable of recording and storing all video, including the exterior cameras, for a minimum of 30 days at high definition resolution. The video management system will transmit video to a video management workstation located in Dispatch, and/or at alternate locations, where live viewing will be permitted of any camera image. All cameras will be capable of transmitting in color and exterior cameras will have low light capability where needed (based upon lighting design and configuration). Software for motion based as well as object based and/or forensic video detection will be used in order to provide discrimination of unwanted versus normal events. Interior cameras will be powered via PoE.

Surveillance cameras will be vandal resistant, include infrared illumination and employed at entry doors from the exterior and interior doors leading from public spaces into private spaces. Cell cameras will be vandal resistant, anti-ligature and will utilize audio analytics to trigger an alarm when a decibel threshold is exceeded. Interview Room cameras will have visibility of the rooms' door and include an integrated microphone for audio recording. Interview Room cameras will require recording at 30 frames per second for matching up seamlessly with the recorded audio. All other cameras will require a maximum of 15 frames per second.

Electronic Control Equipment
Each desk in Dispatch will have a workstation for the access control system and the video management system, a master video intercom, lockdown button and duress button. Each desk will also include a door controller keypad with override buttons for the Sallyport overhead doors, Cell Doors, Lobby doors and other doors requiring electronic override. Although functionality through the access control system can be used for this purpose, a programmed keypad will allow easy access to override typically overridden doors. Additionally, an area in Dispatch will be used to badge employees and will include the badging camera and ID printer.

At the front in Dispatch, large screen monitors will continuously run video feeds from the interior and exterior cameras as well as live television, including local news and weather. These monitors will be in addition to the workstations and monitors at each Dispatch desk that will be used to enlarge single views and review transactions from the access control system.

Speakers and Volume Control
IP speakers will be distributed throughout the facility for integration into the radio system amplifier. Audio control of these speakers will be provided in specific offices and conference rooms. See attached diagrams for speaker locations and areas with volume control.

Two-Way Intercom Communication
Each cell will include audio only communication with Dispatch through master intercom stations. The cell intercoms will be recessed in the wall, anti-ligature and vandal resistant.

E. Infrastructure
Below are the various power, network and conduit requirements for the access control and video assessment systems:

Network:

A. A network connection would be required for each access control panel location. This is typically in the form of a network jack located within the security equipment enclosure.
B. Category cabling will be required for each camera, routed back to a network switch inside a secure closet.
C. Two network connections would be required for each video server recorder; the final configuration for recorders will vary depending on the number of cameras. For most designs, a network switch is installed in one or more of the security equipment racks for the purpose of connecting video servers and mass storage devices.
D. Coordination of IT elements such as data drops, IP addresses and VLAN configuration, if desired, will be conducted well in advance of system deployment and will be closely monitored throughout the system installation.
E. A network connection would be required for each access control, video management, and visitor management workstation.
F. Rack mounted equipment will be installed in a 7 foot server cabinet with locking system.

Power and Fire Alarm:

Power for security devices, as outlined below, should not be shared with any circuit supplying non-security related equipment.

A. Provide one 120VAC 20 Amp UPS circuit and Fire Alarm connection for each access control panel location.
B. Provide one 120VAC 20 Amp UPS circuit for each door to receive an electrified panic hardware device. This circuit may be shared with other security devices.
C. Provide one 120VAC 20 Amp UPS circuit and Fire Alarm connection for each door to receive any type of delayed egress device. This circuit may be shared with other security devices.
D. Provide one 120VAC 20 Amp UPS circuit and Fire Alarm connection for each set of interlocked controlled doors. This circuit may be shared with other security devices.
E. Provide 120VAC UPS power for each pole mounted exterior camera. This circuit may be shared with other security devices.
F. Five 120VAC 20 amp UPS circuits would be required for the security desk.
G. Six 120VAC 20 amp UPS circuits would be required to support the security desk monitors.
H. A rack mounted managed Uninterruptible Power Supply (UPS) with have adequate power to support at least 4 hours of outage in the event of a power loss for all rack-mounted equipment.

Conduit:

A. One 1” conduit would be required for each card reader location. Conduit should be run from the card reader location to the nearest IT closet or cable tray.
B. One ¾” conduit would be required for the following devices and would be run to the nearest IT closet or cable tray:
    1. Video assessment camera
    2. Monitored doors without a card reader
    3. Intercom

TECHNOLOGY

The following is the Technology system narrative which defines scope of work, as well as, basis of design:

1. The Technology system design at Burlington Police Station is designed with Category 6A cable and intended for 10G bps to the workstation. The voice wiring will be capable of VOIP.

2. Technology Components:

Installation and integration of multiple technology components are as follows:

A. Cabling for Voice, Data, and Video Technologies
B. Data Electronics for LAN/WAN Data Infrastructure (not included as part of scope)
C. Data Electronics for Internet Access (not included as part of scope)
D. Data Network Computer Hardware (not included as part of scope)
E. Data Network Software (not included as part of scope)
F. Computer Peripherals (not included as part of scope)

3. Data System:

The data system is designed for a 10 Gig Ethernet (Category 6A cable) with 10G Base-T connection to the workstation. The high-speed data transmission will allow users to retrieve data from the internet and local area network almost instantly. The data system has been designed for users to accomplish:

A. Internet access through a wireless Ian and hard-wired data drops.
B. Applications for word processing, spreadsheet, and alike through a central applications server.
C. Printing of documents from any user computer connected to network printers.
D. Wireless access for employees at the facility.

4. Telephone System:

The telephone system will utilize Category 6A cable similar to the data system. The infrastructure will be designed to accommodate Voice-Over-IP.

5. Cable-TV System:

The Cable-TV system will comprise of a coaxial cable drops at each location. The system will be bi-directional type, which allows for both receiving and transmitting broadband signals.

6. Sound System:

The facility will have a paging/sound system. The system will have inputs from the phone system and paging module.

The paging system will be provided with eight (8) zones.

Volume controls will be provided in private office areas.

Conceptual Structural Narrative

TO:	Kevin Witzell, MCPPO (Kaestle Boos Associate Inc.)
FROM:	Kevin Connolly, P.E. & Henok Bekele, P.E.
DATE:	02/29/2024
SUBJECT:	Schematic Structural Design Narrative for Burlington Police Department

Introduction:

The Burlington Police Department's new headquarter will be situated at 45 Center Street, Burlington, Massachusetts, bordered by Center Street to the west and Sears Street to the north. The proposed building will be fully dedicated to accommodating the Police Department's operations, spanning approximately 16,000 square feet. Comprising two stories with a gabled roof and a basement level, the structure features a sallyport on its eastern side. Two stairwells, positioned at the north and south ends, provide access to the building. In addition, the building has a single elevator that extends from the basement floor to the second-floor level.

The basement floor hosts various facilities including a mechanical room, shooting range, wellness room, simulation room, storage areas, circulation spaces, and other shared amenities. On the first floor, there are meeting rooms, additional storage areas, offices, locker rooms, circulation spaces, and other shared spaces. The second floor encompasses offices, conference rooms, circulation spaces, and other shared amenities. Adjacent to the building, external parking lots are situated on the east and north sides, providing parking space.

Structural System:

Given the building type, size, and economic considerations, the most appropriate structural solution comprises a combination of steel framing for the above-grade portions and cast-in-place concrete for the below-grade levels. For the proposed structure, steel-framed superstructure offers better performance, cost, and expedited construction timelines. For the below-grade level, a cast-in-place concrete structure provides a suitable option, offering durability, performance, and watertightness. Reinforced concrete sub-structure provides a robust foundation wall and basement structure capable

of withstanding various environmental factors and supporting the weight of the above-grade portions effectively.

Lateral Force Resisting System:

The structure's vertical lateral force resisting system will be designed to withstand both seismic and wind forces by providing a combination of braced frames and moment frames in each direction. According to the 780 CMR 10th edition, both the braced and moment frame systems can be designated and designed as "System Not Specifically Detailed for Seismic Resistance." Braced frames will typically comprise W12 or W14 columns, W16 beams, and HSS braces, with brace configurations including chevrons, X-braces or diagonal braces, chosen based on architectural considerations. Moment frames will typically consist of W12 or W14 columns and W16 or W18 beams.

The load path for lateral forces will involve the transfer of seismic and wind lateral loads through the floor diaphragm and connectors to the vertical lateral force resisting system, which will be either the braced frame or the moment frame. The first and second-floor diaphragms will be constructed from composite metal deck, comprising concrete fill on metal deck, connected to the steel framing with welded headed studs. This composite construction will create a rigid diaphragm, facilitating the transfer of lateral loads based on the stiffness of the vertical lateral resisting systems. To ensure effective composite action of the concrete metal deck, embedded conduits should not be placed in the concrete slab.

The roof diaphragm, on the other hand, will be constructed from metal deck. Due to its in-plane stiffness, the metal deck will behave as a flexible diaphragm, and lateral load transfer will be analyzed based on deformed simple beam analysis.

Gravity Force Resisting System:

The structure will support various gravity loads, including dead load, live load, snow load, vertical wind and seismic load, and equipment loads, which will be supported by a system of interconnected structural elements. These elements, including the roof metal deck, roof steel trusses, composite slab deck, steel beams, steel columns, concrete foundation walls, concrete slab-on-grade, and concrete footings, serve as integral components in the load-bearing mechanism. The gravity load path involves transferring vertical loads from the roof deck or composite deck to beams, then to columns, and further to foundation walls and footings, distributing them to the bearing soil.

Roof Construction:

The roof will be constructed as a gabled structure and will consist of 1 ½ inches x 18 gauge galvanized steel roof deck, supported by steel trusses. The truss construction will incorporate either HSS (Hollow Structural Sections), double angles, or wide flange shapes. Infill beams will be added to provide additional bracing for the trusses. In addition to the loads mandated by building codes, the design of the roof system will also consider potential future photovoltaic (PV) panels.

First Floor & Second Floor Construction:

As part of sustainable design practices, consideration will be given to the use of lightweight concrete on metal deck for the composite floor system. The composite slab deck will consist of 3 ¼'' lightweight concrete (LWC) with 6x6-W2.1xW2.1 welded wire fabric placed on 3''x18 gauge metal deck, totaling 6 ¼'' in thickness, spanning between wide flange steel beams. Beam spacing will be determined to prevent the need for shoring of the composite deck. The floor beams will be wide flange shape with typical spacing at 8 ft center to center. Columns will typically consist of W10 or HSS tubes. To ensure composite action between the floor concrete deck and supporting beams, ¾'' diameter x 4'' welded head stud shear connectors will be employed.

Basement Floor Construction:

The basement slab-on-grade will typically be constructed with a 6-inch-thick cast-in-place concrete, reinforced with 6x6-W4.0X4.0 welded wire fabric. The final size and type of the slab-on-grade will be determined upon receipt of the geotechnical investigation report. Below the slab, there will be a polyethylene vapor barrier, rigid insulation, and a minimum of 12 inches of compacted crushed stone bedding for drainage. Isolation joints will be incorporated at slab-to-wall and column joints, as well as at intervals of no more than 20 feet along the slab length.

Along the perimeter of the basement floor, a 16-inch concrete foundation wall will be constructed to provide support against earth and hydrostatic pressure. The design of the foundation wall will use the coefficient of at-rest soil pressure, assuming pin support at the first-floor level.

The requirement for a foundation drainage system and/or waterproofing depends on factors such as site grading and groundwater levels. This determination will be made following the geotechnical investigation report.

Foundations:

At the time of preparing this report, the geotechnical analysis of the area is not available. Typically, the foundation wall will be supported on a continuous reinforced concrete footing. Additionally, it is anticipated that steel columns will be supported by shallow reinforced concrete isolated footings. Strap footings will be employed at the foundation of braced columns, where strap beams will connect the two columns. The specific type and dimensions of the foundation will be determined based on recommendations from the geotechnical report. All information provided herein should be regarded as assumptions until the geotechnical analysis is available.

Steel Connections:

Structural connections will encompass typical double angle shear connections, shear plate connections, moment connections, and bearing connections. These connections will utilize bolts and welding for their assembly. The design of the connections will be delegated items.

Seismic Expansion Joint:

The proposed building is anticipated not to require a seismic expansion joint. However, the final decision on whether one is necessary will follow a comprehensive lateral evaluation of the building.

Special Structural Considerations:

Per ASCE 7-16, the seismic evaluation of the proposed building involves consideration of horizontal structural irregularity due to the angled L-shaped configuration of the proposed building. Moreover, the seismic evaluation will consider vertical structural irregularity due to the proposed building setbacks where certain sections of the building do not have second floor level.

Sustainable Design Considerations:

Light weight concrete on metal deck will be considered as part of sustainable design considerations.

Exterior Walls:

Per architectural considerations, the exterior skin will be a combination of materials including brick, metal panels and aluminum curtain wall, backed up by light gauge steel studs at office areas and 8" cmu at detention/sallyport areas. To support brick veneer, continuous hot dipped galvanized steel relieving angles may be provided at second floor level.

Structural Design Applicable Building Codes and Standards:

The structural analysis and design of the proposed building will be based on the following building codes and standards:

- IBC 2021 "International Building Code"
- 780 CMR "Massachusetts Amendments, 10th Edition"
- ASCE 7-16 "Minimum Design Loads for Buildings and Other Structures"
- AISC 360-16 "American Institute of Steel Construction"
- ACI 318-14 "Building Code Requirements for Structural Concrete"
- TMS 402/602-16 "Building Code Requirements & Specification for Masonry Structures"
- AWS D1.1/D1.1M "Structural Welding Code - Steel"
- SDI "Steel Deck Institute – Latest Edition"

Design Load Criteria

- Building Occupancy: Police department
- Building Risk Category: IV

Gravity Loads:

- Dead Loads:
  - Actual Weight of Building Components
  - Floor Hung Ceiling/Mech./Misc/Finishes: 15 psf
  - Roof Hung Ceiling/Mech./Misc./Finishes: 20 psf
  - Future Photovoltaic (PV) Panel: 8 psf

- Perimeter Façade Load: 25 psf

- Uniformly distributed Live Loads:
  - Office Plus Partition: 65 psf
  - Assembly Areas, First Floor Corridor, Stairs: 100 psf
  - Second Floor Corridor: 80 psf
  - Mechanical Areas, Storage: 150 psf
  - Roof: 20 psf
- Unbalanced Live Loading

  Unbalanced live loading criteria shall be applied in situations where such loading results in greater demands on members or connections compared to balanced load conditions.
- Live Load Reduction

  Live load reduction will be considered per ASCE 7-16 requirements.
- Concentrated Live Loads

  Floors will be designed to accommodate either the uniformly distributed live loads specified or the concentrated loads listed below, whichever results in higher stress levels. The concentrated load will be positioned to generate the maximum stress condition in the structural members.
  - Stair treads: 300 lbs
  - Office: 2000 lbs
  - Guardrails, Handrails & Parapets: 200 lbs vertically or horizontally

  For actual conditions generating concentrated loads exceeding those tabulated above, the structural components must be designed to withstand the higher loads.
- Impact Load

  Impact loads will be accounted for by increasing the elevator load in accordance with the manufacturer's recommendations. Additionally, any mechanical equipment subject to vibration will have its load increased based on manufacturer guidelines for impact.
- Snow Load:
  - Ground Snow Load, Pg: 50 psf
  - Min. Flat Roof Snow Load, Pf: 30 psf
  - Snow drift resulting from building setbacks and changes in geometry will be calculated and incorporated into the design process.

Lateral Loads:

- Wind Load:
  - Design Wind Speed: 131 mph
  - Minimum downward Wind pressure: 16 psf
- Seismic Load:
  - Short Period Spectral Response Acceleration, Ss: 0.314
  - 1.0 Sec. Spectral Response Acceleration, S1: 0.071
  - Site Class: D (Assumed)
  - Risk Category: IV
  - Importance Factors: 1.5
  - Sds: 0.324

- Sd1: 0.113
- Long Period, $T_{L:}$ 6
- Seismic Design Category: C
- Lateral Load Resisting System: Combination of Steel Bracing & Moment Frames which will be designed as "Not Specifically Detailed for Seismic Resistance." Per 780 CMR.
- Response Modification Factor (R): 3.0
- System Overstrength Factor (W0): 3.0
- Deflection Amplification Factor (Cd): 3.0

- Soil Loads

  During the preparation of this report, a geotechnical investigation report was not available. Geotechnical parameters, including but not limited to lateral earth pressure coefficients, allowable soil bearing pressure, seismic soil site class, sliding soil coefficient, groundwater level, and frost depth, will be obtained from a geotechnical investigation of the proposed building area.

Load combinations:

Load and Resistance Factor Design (LRFD):

The strength design of the structures will adhere to the LRFD load combinations specified by either IBC 2021 or ASCE 7-16. The structural strength will be determined based on the appropriate critical combination of factored loads.

Allowable Service Design (ASD):

The serviceability requirements of the structural elements will be determined based on the critical ASD (Allowable Stress Design) load combination specified by either IBC 2021 or ASCE 7-16.

Deflection Requirements:

- The maximum deflection limit requirements of the structural elements will be determined according to IBC 2021, Table 1604.3.
- The wind load deflection of the proposed building shall not exceed 1/400 of the total building height under service level wind loads for a 50-year return period event.
- Façade deflection criteria will be established in collaboration with facade consultants.

Material Specifications

- Structural Steel
  - Rolled wide flange shapes shall conform to ASTM A992, Grade 50.
  - Hollow structural tubes shall conform to ASTM A500 GR. C, minimum yield strength 46 ksi.
  - All connection materials and base plates shall conform to ASTM A572.
  - Steel plates, angles and channels shall conform to ASTM A36.
  - Anchor rods shall conform to ASTM F1554, Gr. 55, unless otherwise noted on drawings.

- Bolted connection shall conform to A325 or A490, type N bolts, except slip-critical bolts shall be used at lateral brace beam connections, and prestressed bolts shall be used at beams that support equipment vibrations.
- Headed shear stud shall conform to ASTM A108.
- All welded connections shall be made by approved certified welders and shall conform to AWS D1.1 E70XX.
- Structural steel shapes, plates and connections exposed to weather shall be hot-dipped galvanized.

- Steel Metal Deck
  - Roof deck shall be 1 ½" x 18-gauge conforming to hot-dipped galvanized ASTM A653 SS G90 with coating class G60.
  - Composite slab deck shall be 3" x 18-gauge composite metal deck conforming to ASTM A653 SS GR50 with coating class G60.

- Concrete

  All concrete shall have a minimum 28-day compressive strength as stated below:
  - Concrete slab on metal deck: 4000 psi (Light weight concrete)
  - Footings, Foundation wall, Interior Slab-On-Grade: 4000 psi (Normal weight concrete)
  - Exterior slabs, equipment pads, exterior curbs: 5000 psi (Normal weight concrete)
  - Non-shrink grout: 5000 psi
  - Portland Cement shall conform to ASTM C150, Type I or II

- Concrete Reinforcing
  - All reinforcing bars, ties and stirrups shall be ASTM A615 Grade 60 deformed bars.
  - Welded wire fabric shall conform to ASTM A185, flat sheets.
  - Reinforcing steel shall be uncoated and deformed.

- Reinforced Masonry

  The proposed building will have reinforced masonry in the detention and sallyport area. The masonry material strength shall be as follows:
  - Masonry blocks shall have a minimum of 1500 psi compressive strength.
  - Concrete masonry units shall conform to ASTM C-90 or C-145 grade N-1.
  - Mortar shall conform to ASTM C-270, type M OR S.
  - Grout shall conform to ASTM C-476 fine or coarse with a minimum compressive strength of 3000 psi.
  - Reinforcing bars shall conform to ASTM A 615 Grade 60 deformed bars. Typically, for non-bearing walls, (1) #5@24'' O.C. vertical and (2) #5@48'' O.C. horizontal will be used. All cells with reinforcement bar will be grouted.

Preliminary Opinion of Probable Construction Costs

The preliminary opinion of probable constructions costs for the proposed building is as follows:

Preliminary Cost Estimate		
Description	*Quantity*	*Notes*
Steel Framing	+/- 315 Tons	▪ Assuming 13 psf Steel * Three Levels ▪ Provide 10% Allowance for Connections, Plates, Welds, and Bolts.
Steel Beam Penetrations	Reinforced 10 Per Floor Unreinforced 5 Per Floor	Assume 75% Shop Fabricated & 25% in the Field Installed
6'' Thick Concrete Slab	6x6-W4.0XW4.0 WWF	Basement Level Area, First Floor Outside Basement Area
3 ¼'' LWC on 3''x18 Ga. Composite Deck	TBD	First Floor Area & Second Floor Area
1 ½'' X 18 Ga. Roof Deck	TBD	Gabled Roof Area
8''x12'' Concrete Curbs	+/- 4 PLF	At Base of Masonry Partitions
16''x4'-0'' Thick Concrete Grade Beam	+/- 45 PLF Rebar	
16'' Thick Concrete Foundation Wall	+/- 10 PSF Rebar	Around Perimeter of the Basement Floor. Outside Face of the Wall will have Troweled-on Bituminous Mastic
Isolated Column Concrete Footings	TBD	Typically, Footings within basement area will be Located at 12'' below top of Slab, and at a minimum of 4'-0'' Below Grade Level Outside of Basement Area.
Concrete Pilasters/Piers	TBD	At Perimeter Columns and at Columns outside of the Basement Area.
14''x 3'-0'' Cont. Concrete Footing	+/- 10 PLF	At Foundation Wall
Strap Beams	TBD	Between Footings of Braced Frame Columns
Elevator Pit Concrete Walls and Slabs	+/- 5 PSF	

Additional structural quantities that should be considered includes but not limited to the following:
Elevator Guiderail, Hoist Beam, Slab Edge Plates, SOG Vapor Barrier, Openings in Slab, Miscellaneous Metals.

Owner's Construction Contingency	5%		$1,127,000		
Probable Total Construction Cost:				**$33,997,000**	
Equipment Costs					
Audio Visual Equipment	Allow.		$528,000		
Furnishings, Furniture	Allow.		$481,000		
Firing Range HVAC Equip	Allow.		$610,000		Relocated 4 lanes & add 1 new lane
Loose Equipment	Allow.		$173,000		
IT Equipment					
Network Equipment	Allow.		$135,000		
Computer Equipment	Allow.		$200,000		
Telephone Equipment	Allow.		$109,000		
Communications Equipment	Allow.		$220,000		
Communications Tower	Allow.		$139,000		
Communications Consoles (5)	Allow.		$200,000		
Security / Access Control	Allow.		$905,000		
				$3,700,000	
Equipment Contingency	5.0%		$184,900		
Total Probable Cost of Equipping:				**$3,884,900**	
Owner's Indirect Cost Contingency					
Basic A/E Fee			$3,400,000		
Basic Project Manager Fee			$1,700,000		
Reimbursables/Add Service	Allow.		$100,000		
Structural Peer Review			$18,000		
Utility Backcharges	Allow.		$50,000		
Moving	Allow.		$50,000		
Reproduction / Miscellaneous			$25,000		
Legal / Advertising			$15,000		
Owner’s Indirect Cost Contingency	Allow.		$150,000		
Temp station (Trailers)	Allow.		$2,000,000		Trailer farm on Town Property
Material Testing			$75,000		
				$7,583,000	
Owner's Indirect Contingency	5%		$757,900		
Probable Owner's Indirect Costs:				**$8,340,900**	
Total Project Cost:				**$46,222,800**

Burlington Police Station

Burlington, MA

Project #23000-01

March 22, 2024

Schematic Estimate

Architect:

Kaestle Boos Associates, Inc.

416 Slater Road

New Britain, CT 06053

Phone: 860-229-0361 | Fax: 860-229-5303

Email: kba@kba-architects.com | Web: www.kba-architects.com

Cost Estimator:

Miyakoda Consulting Inc.

PO Box 120731

Boston, MA 02111

(617) 799-5832

Burlington Police Station

Burlington, MA

Introduction

Basis For The Estimate:

1. The project consists of a new Police for Burlington, MA
2. This project will be built in 1 phase.

Project Particulars:

1. The Burlington Police Station Estimate is based on drawings by Kaestle Boos Associates, Inc.

Assumptions:

1. The project will be publicly bid amongst GC builders. This project will be bid with no less than four General Contractos bidding the project.
2. Our costs assume that there will be competitive bidding in all trades and sub-trades i.e. at least three bids per trade or sub-
3. Unit rates are based on current dollars (prevailing wage rates)
4. Design Contingency is an allowance for unforeseen design issues, design detail development and specification clarifications
5. General Conditions and Requirements value covers Construction Manager's site office overhead and on-site supervision
6. Fee markup is calculated on a percentage of direct construction costs.
7. Escalation included
8. Assume Construction to Begin June 2025

Exclusions within the Estimate:

1. Design fees and other soft costs
2. Interest expense
3. Owner's project administration
4. Construction of temporary facilities
5. Printing and advertising
6. Specialties, loose furnishings, fixtures and equipment beyond what is noted
7. Site or existing condition surveys and investigations
8. Hazardous materials survey, report and abatement
9. Demolition of existing building(s)

Burlington Police Station

Burlington, MA

Main Summary

38,206 GSF

DESCRIPTION			TOTAL	COST/SF
Building Demolition			$540,000	
Abatement			NIC	
Substation Building		36,406 GSF	$18,868,348	$518.28
Sitework			$2,227,018	
Auxiliary Building		1,800 GSF	$990,000	$550.00
Trade Cost Subtotal		38,206 GSF	**$22,625,366**	**$592.19**
Design Contingency	15.00%		$3,393,805	$88.83
Trade Cost Total			**$26,019,171**	**$681.02**
Mark-ups (on Direct Trade Costs Subtotal)				
General Conditions and Requirements	9.00%	$26,019,171	$2,341,725	$61.29
Insurance	1.40%	$28,360,896	$397,053	$10.39
Bonds	1.00%	$28,757,949	$287,579	$7.53
Permit		$29,045,528	NIC	
Fee	3.00%	$29,045,528	$871,366	$22.81
Estimate Construction Cost Subtotal			**$29,916,894**	**$783.04**
Escalation To The Midpoint of Construction **Assume Construction to Begin June 2025**	10.67%	$29,916,894	$3,192,133	$83.55
ECC Total, including Escalation			**$33,109,027**	**$866.59**
